## Preface

Yes, irrigation! In near future, energy become a luxury item and water is considered as the most vital item in the world due to reduction of water resources in most regions. Furthermore, the most water consumption belongs to agriculture and irrigation. In this condition, role of water science researchers and irrigation experts is important more than ever. If an irrigation engineer student is not educated well, he/she will not solve problems of water sciences in the future. Many engineer students learn all necessary lessons in the university, but they cannot to answer to the problems or to pass the exams because of forgetfulness or lack of enough exercise. This book contains one hundred essential problems related to irrigation engineering with a small volume. Undoubtedly, many problems can be added to the book but the author tried to mention only more important problems and to prevent increasing volume of the book due to help to feature of portability of the book. To promote student's skill, both SI and English systems have been used in the problems and a list of important symbols has been added to the book. All of the problems were solved completely. This book is useful for not only exercising and passing the university exams but also for use in actual project as a handbook. The handbook of irrigation engineering problems is usable for agricultural, civil, and environmental students, teachers, experts, researchers, engineers, designers, and all enthusiastic readers in surface and pressurized irrigation, drainage engineering, agricultural water management, water resources, hydrology, hydrogeology, hydro climatology, hydrometeorology, and hydraulic fields. The prerequisite to study the book and to solve the problems is each appropriate book about irrigation science; however, the author recommends studying the references to better understanding the problems and presented solutions. It is an honor for the author to receive any review and suggestion to improve quality of the book.

## About Author

Mohammad Valipour is a Ph.D. candidate in Agricultural Engineering-Irrigation and Drainage at Sari Agricultural Sciences and Natural Resources University, Sari, Iran. He completed his B.Sc. Agricultural Engineering-Irrigation at Razi University, Kermanshah, Iran in 2006 and M.Sc. in Agricultural Engineering-Irrigation and Drainage at University of Tehran, Tehran, Iran in 2008. Number of his publications is more than 50. His current research interests are surface and pressurized irrigation, drainage engineering, relationship between energy and environment, agricultural water management, mathematical and computer modeling and optimization, water resources, hydrology, hydrogeology, hydro climatology, hydrometeorology, hydro informatics, hydrodynamics, hydraulics, fluid mechanics, and heat transfer in soil media.

$\mathrm{EC}_{\text {e, threshold }}$ electrical conductivity of the saturation extract of the soil above which yield begins to decrease [dS m${ }^{-1}$ ]
ET evapotranspiration [mm day ${ }^{-1}$ ]
$E T_{\text {o }}$ reference crop evapotranspiration [mm day ${ }^{-1}$ ]
$E T_{c}$ crop evapotranspiration under standard conditions [mm day ${ }^{-1}$ ]
$E T_{c}$ adj crop evapotranspiration under non-standard conditions [mm day ${ }^{-1}$ ]
$\exp [\mathrm{x}] 2.7183$ (base of natural logarithm) raised to the power x
Fr resistance correction factor [-]
$\mathrm{f}_{\mathrm{c}} \quad$ fraction of soil surface covered by vegetation (as observed from overhead) [-]
$\mathrm{f}_{\mathrm{c} \text { eff }}$ effective fraction of soil surface covered by vegetation [-]
$1-f_{c}$ exposed soil fraction [-]
$\mathrm{f}_{\mathrm{w}} \quad$ fraction of soil surface wetted by rain or irrigation [-]
$\mathrm{f}_{\text {ew }}$ fraction of soil that is both exposed and wetted (from which most evaporation occurs)
[-]
G soil heat flux [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$\mathrm{G}_{\text {day }}$ soil heat flux for day and ten-day periods [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$\mathrm{G}_{\mathrm{hr}}$ soil heat flux for hourly or shorter periods [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ hour $^{-1}$ ]
$\mathrm{G}_{\text {month }}$ soil heat flux for monthly periods [MJ m${ }^{-2}$ day $^{-1}$ ]
$\mathrm{G}_{\mathrm{sc}}$ solar constant [0.0820 MJ m${ }^{-2} \mathrm{~min}^{-1}$ ]
H sensible heat $\left[\mathrm{MJ} \mathrm{m}{ }^{-2}\right.$ day $^{-1}$ ]
$\mathrm{H}_{\mathrm{WR}}$ height to width ratio
$h$ crop height [m]
I irrigation depth [mm]
$\mathrm{I}_{\mathrm{w}} \quad$ irrigation depth for that part of the surface wetted [mm]
$J$ number of day in the year [-]
$\mathrm{K}_{\mathrm{c}} \quad$ crop coefficient [-]
$\mathrm{K}_{\mathrm{c} \text { ini }}$ crop coefficient during the initial growth stage [-]
$\mathrm{K}_{\mathrm{c} \text { mid-crop }}$ coefficient during the mid-season growth stage [-]
$\mathrm{K}_{\mathrm{c} \text { end }}$ crop coefficient at end of the late season growth stage [-]
$\mathrm{K}_{\mathrm{c} \max }$ maximum value of crop coefficient (following rain or irrigation) [-]
$\mathrm{K}_{\mathrm{c} \text { min }}$ minimum value of crop coefficient (dry soil with no ground cover) [-]
$\mathrm{K}_{\mathrm{cb}}$ basal crop coefficient [-]
$\mathrm{K}_{\mathrm{cb} \text { full }}$ basal crop coefficient during mid-season (at peak plant size or height) for vegetation with full ground cover of LAI > 3 [-]
$\mathrm{K}_{\mathrm{cb} \text { ini }}$ basal crop coefficient during the initial growth stage [-]
$\mathrm{K}_{\mathrm{cb} \text { mid }}$ basal crop coefficient during the mid-season growth stage [-]
$\mathrm{K}_{\mathrm{cb} \text { end }}$ basal crop coefficient at end of the late season growth stage [-]
$\mathrm{K}_{\text {esoil }}$ evaporation coefficient [-]
$\mathrm{K}_{\mathrm{p} \text { pan }}$ coefficient [-]
$\mathrm{K}_{\mathrm{r} \text { soil }}$ evaporation reduction coefficient [-]
$\mathrm{K}_{\mathrm{s}} \quad$ water stress coefficient [-]
$\mathrm{K}_{\mathrm{y}} \quad$ yield response factor [-]
$\mathrm{k}_{\mathrm{Pa}}$ atmospheric pressure
$\mathrm{k}_{\mathrm{von}}$ Karman's constant [0.41] [-]
$\mathrm{k}_{\mathrm{Rs}}$ adjustment coefficient for the Hargreaves' radiation formula [ ${ }^{\circ} \mathrm{C}-0.5$ ]
$\mathrm{L}_{\text {ini }}$ length of initial growth stage [day]
$\mathrm{L}_{\text {dev }}$ length of crop development growth stage [day]
$\mathrm{L}_{\text {mid }}$ length of mid-season growth stage [day]
$\mathrm{L}_{\text {late }}$ length of late season growth stage [day]
$\mathrm{L}_{z}$ longitude of centre of local time zone [degrees west of Greenwich]
$\mathrm{L}_{\mathrm{m}}$ longitude [degrees west of Greenwich]
LAI leaf area index [ $\mathrm{m}^{2}$ (leaf area) $\mathrm{m}^{-2}$ (soil surface)]
LAIactive active (sunlit) leaf area index [-]
N maximum possible sunshine duration in a day, daylight hours [hour]
n actual duration of sunshine in a day [hour]
$\mathrm{n} / \mathrm{N}$ relative sunshine duration [-]
P rainfall [mm]
$\mathrm{p}_{\text {evapotranspiration }}$ depletion factor [-]
$\mathrm{R} \quad$ specific gas constant $\left[0.287 \mathrm{~kJ} \mathrm{~kg}^{-1} \mathrm{~K}^{-1}\right]$
$\mathrm{R}_{\mathrm{a}} \quad$ extraterrestrial radiation [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$\mathrm{R}_{1} \quad$ long wave radiation [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$\mathrm{R}_{\mathrm{n}}$ net radiation [ $\mathrm{MJ} \mathrm{m}^{-2}$ day $^{-1}$ ]
$\mathrm{R}_{\mathrm{nl}}$ net long wave radiation [ $\mathrm{MJ} \mathrm{m} \mathrm{m}^{-2}$ day $^{-1}$ ]
$R_{n s}$ net solar or shortwave radiation [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$R_{s}$ solar or shortwave radiation [ $\mathrm{MJ} \mathrm{m}{ }^{-2}$ day $^{-1}$ ]
$R_{\text {so }} \quad$ clear-sky solar or clear-sky shortwave radiation [ $\mathrm{MJ} \mathrm{m}^{-2}$ day $^{-1}$ ]
$r_{a} \quad$ aerodynamic resistance $\left[\mathrm{s} \mathrm{m}^{-1}\right.$ ]
$r_{1}$ bulk stomatal resistance of well-illuminated leaf $\left[\mathrm{s} \mathrm{m}^{-1}\right]$
$r_{s} \quad$ (bulk) surface or canopy resistance [ $\mathrm{s} \mathrm{m}^{-1}$ ]
$R_{s} / R_{s o}$ relative solar or relative shortwave radiation [-]
$\mathrm{R}_{\mathrm{Aw}}$ readily available soil water of the root zone [mm]
$R_{E W}$ readily evaporable water (i.e., maximum depth of water that can be evaporated from the soil surface layer without restriction during stage 1) [mm]
$\mathrm{R}_{\mathrm{H}}$ relative humidity [\%]
$\mathrm{RH}_{\mathrm{hr}}$ average hourly relative humidity
$\mathrm{RH}_{\text {max }}$ daily maximum relative humidity [\%]
$\mathrm{RH}_{\text {mean }}$ daily mean relative humidity [\%]
$\mathrm{RH}_{\text {min }}$ daily minimum relative humidity [\%]
RO surface runoff [mm]
$\mathrm{Sc}_{\text {seasonal }}$ correction factor for solar time [hour]
$\mathrm{S}_{\mathrm{F}} \quad$ subsurface flow [mm]
$\mathrm{T}_{\text {air }}$ temperature [ ${ }^{\circ} \mathrm{C}$ ]
$\mathrm{TK}_{\text {air }}$ temperature $[\mathrm{K}]$
$\mathrm{TK}_{\mathrm{v}}$ virtual air temperature $[\mathrm{K}]$
$\mathrm{T}_{\text {dew }}$ dew point temperature $\left[{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\text {dry }}$ temperature of dry bulb [ $\left.{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\text {max }}$ daily maximum air temperature [ $\left.{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\text {max,K }}$ daily maximum air temperature $[\mathrm{K}]$
$\mathrm{T}_{\text {mean }}$ daily mean air temperature $\left[{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\text {min }}$ daily minimum air temperature [ $\left.{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\text {min,K }}$ daily minimum air temperature [K]
$\mathrm{T}_{\text {wet }}$ temperature of wet bulb $\left[{ }^{\circ} \mathrm{C}\right]$
$\mathrm{T}_{\mathrm{AW}}$ total available soil water of the root zone [mm]
$\mathrm{T}_{\mathrm{Ew}}$ total evaporable water (i.e., maximum depth of water that can be evaporated from the soil surface layer) [mm]
t time [hour]
$\mathrm{u}_{2}$ wind speed at 2 m above ground surface $\left[\mathrm{m} \mathrm{s}^{-1}\right.$ ]
$u_{z}$ wind speed at $z \mathrm{~m}$ above ground surface $\left[\mathrm{m} \mathrm{s}^{-1}\right]$
W soil water content [mm]
$\mathrm{Y}_{\mathrm{a}} \quad$ actual yield of the crop $\left[\mathrm{kg} \mathrm{ha}{ }^{-1}\right]$
$Y_{m}$ maximum (expected) yield of the crop in absence of environment or water stresses [kg $\mathrm{ha}^{-1}$ ]
$Z_{e} \quad$ depth of surface soil layer subjected to drying by evaporation [m]
$Z_{r} \quad$ rooting depth [m]
$z$ elevation, height above sea level [m]
$z_{h} \quad$ height of humidity measurements [m]
$z_{m} \quad$ height of wind measurements [m]
$z_{\text {om }}$ roughness length governing momentum transfer [m]
$z_{\text {oh }}$ roughness length governing heat and vapor transfer [m]
a albedo [-]
$\gamma \quad$ psychrometric constant $\left[\mathrm{kPa}^{\circ} \mathrm{C}^{-1}\right]$
$\gamma_{\text {psy }}$ psychrometric constant of instrument $\left[\mathrm{kPa}{ }^{\circ} \mathrm{C}^{-1}\right]$
$\Delta \quad$ slope of saturation vapor pressure curve $\left[\mathrm{kPa}{ }^{\circ} \mathrm{C}^{-1}\right]$
$\Delta \mathrm{SW}$ variation in soil water content [mm]
$\Delta t \quad$ length of time interval [day]
$\Delta z \quad$ effective soil depth [m]
$\delta$ solar declination [rad]
$\varepsilon \quad$ ratio molecular weight of water vapor/dry air $(=0.622)$
$\eta \quad$ mean angle of the sun above the horizon
$\theta$ soil water content [ $\mathrm{m}^{3}$ (water) $\mathrm{m}^{-3}$ (soil)]
$\theta_{\mathrm{FC}}$ soil water content at field capacity [m ${ }^{3}$ (water) $\mathrm{m}^{-3}$ (soil)]
$\theta_{\mathrm{t}}$ threshold soil water content below which transpiration is reduced due to water stress [ $\mathrm{m}^{3}$ (water) $\mathrm{m}^{-3}$ (soil)]
$\theta_{\mathrm{WP}}$ soil water content at wilting point [ $\mathrm{m}^{3}$ (water) $\mathrm{m}^{-3}$ (soil)]
$\lambda$ latent heat of vaporization $\left[\mathrm{MJ} \mathrm{kg}{ }^{-1}\right.$ ]
$\lambda_{\mathrm{ET}} \quad$ latent heat flux $\left[\mathrm{MJ} \mathrm{m} \mathrm{m}^{-2}\right.$ day $\left.^{-1}\right]$
$\rho_{a} \quad$ mean air density $\left[\mathrm{kg} \mathrm{m}^{-3}\right]$
$\rho_{\mathrm{w}}$ density of water $\left[\mathrm{kg} \mathrm{m}^{-3}\right]$
$\sigma \quad$ Stefan-Boltzmann constant [4.903 10-9 $\mathrm{MJ} \mathrm{K}^{-4} \mathrm{~m}^{-2}$ day $^{-1}$ ]
$\varphi \quad$ latitude [rad]
$\omega$ solar time angle at midpoint of hourly or shorter period [rad]
$\omega 1$ solar time angle at beginning of hourly or shorter period [rad]
$\omega 2$ solar time angle at end of hourly or shorter period [rad]
$\omega \mathrm{s}$ sunset hour angle [rad]

## Problems

1. In the table, available water has been showed in each quarter of root depth. Maximum allowable depletion is 50 percent and daily crop water requirement is 8 millimeters. Determine critical quarter in commence of irrigation and irrigation interval.

| Quarter of root depth | Soil texture | Available water | Allowed water depletion |
| :---: | :---: | :---: | :---: |
| 1 | CL | 50 | 40 |
| 2 | CL | 50 | 30 |
| 3 | SL | 20 | 20 |
| 4 | SiL | 60 | 10 |

Readily available water $=($ Available water - Allowed water depletion $) \times$ Maximum allowable depletion

| Quarters of root depth | Readily available water |
| :---: | :---: |
| 1 | 5 |
| 2 | 10 |
| 3 | 6 |
| 4 | 24 |

Quarter 1 is critical quarter.
Irrigation interval $=\frac{\sum(\text { Readily available water })}{\text { Crop water requirement }}=\frac{(5+10+6+24)}{8}=5.625 \cong 5$ days
2. In a sprinkle irrigation system, Distance of irrigation machine movement is $\mathbf{6 0}$ meters, the velocity is 36 meters per hour, and discharge of gun sprinkler is 50 cubic meters per hour. Determine value of precipitation as millimeter.

$$
\mathrm{S}_{1}=60 \mathrm{~m} \quad \mathrm{v}=36 \mathrm{~m} / \mathrm{hr} \quad \mathrm{Q}_{\mathrm{g}}=50 \mathrm{~m}^{3} / \mathrm{hr}
$$

$\mathrm{I}=\frac{\mathrm{Q}_{\mathrm{g}}}{\mathrm{S}_{1} \times \mathrm{v}}=\frac{50}{60 \times 36}=23.148 \mathrm{~mm}$
3. In a trickle irrigation system, maximum allowable depletion is 35 percent, moisture area is 46 percent, root depth is 1.8 meters, soil water holding capacity is 95 millimeters (in root depth), water requirement is 5 millimeters, canopy is 75 percent, electrical conductivity of saturated paste extract is 8 deciSiemens per meter, and electrical conductivity of irrigation water is 0.3 deciSiemens per meter. Determine maximum net irrigation depth, maximum daily transpiration, maximum irrigation interval, and

## leaching requirement.

$\mathrm{MAD}=35 \% \quad \mathrm{P}_{\mathrm{w}}=46 \% \quad \mathrm{Z}=1.8 \mathrm{~m} \quad \mathrm{U}_{\mathrm{d}}=5 \mathrm{~mm} \quad \mathrm{P}_{\mathrm{d}}=75 \% \quad \mathrm{EC}_{\mathrm{e}}=8 \mathrm{dS} / \mathrm{m}$
$\mathrm{w}_{\mathrm{a}}=\frac{95 \mathrm{~mm}}{1.8 \mathrm{~m}} \quad \mathrm{EC}_{\mathrm{w}}=0.3 \mathrm{dS} / \mathrm{m}$
Maximum net irrigation depth $=\frac{\mathrm{MAD}}{100} \times \frac{\mathrm{P}_{\mathrm{w}}}{100} \times \mathrm{Z} \times \mathrm{w}_{\mathrm{a}}=\frac{35}{100} \times \frac{46}{100} \times 1.8 \times \frac{95}{1.8}=15.295 \mathrm{~mm}$
Maximum daily transpiration $=$ Maximum net irrigation depth $\times \frac{P_{d}}{100}=15.295 \times \frac{75}{100}=11.5 \mathrm{~mm} /$ day
Maximum irrigation interval $=\frac{\mathrm{U}_{\mathrm{d}}}{\mathrm{T}_{\mathrm{d}}}=\frac{5}{11.471}=10.461 \mathrm{hr} \cong 10 \mathrm{hr}$
Leaching requirement $=\frac{\mathrm{EC}_{\mathrm{w}}}{5 \times \mathrm{EC}_{\mathrm{e}}-\mathrm{EC}_{\mathrm{w}}}=\frac{0.3}{5 \times 8-0.3}=0.008$
4. In a square area ( $640000 \mathrm{~m}^{2}$ ), irrigation efficiency of a center pivot system is 70 percent, maximum daily evapotranspiration is 7.6 millimeters, effective radius of end sprinkler is 14 meters, readily available water is $\mathbf{4 0}$ millimeters, and maximum irrigation depth is 18 millimeters. Determine discharge of center pivot system, maximum time of irrigation, acceptable rotational velocity as hour, and rotational velocity of end sprinkler as meter per minute.

$$
\begin{array}{cccc}
\mathrm{l}=800 \mathrm{~m} \quad \mathrm{E}_{\mathrm{a}}=70 \% & \mathrm{DDIR}=7.6 \mathrm{~mm} / \mathrm{day} & \mathrm{R}_{\mathrm{e}}=14 \mathrm{~m} & \mathrm{RAW}=40 \mathrm{~mm} \\
\mathrm{~A}=\pi \mathrm{X} \mathrm{R}^{2}=\pi \times 400^{2}=5.027 \times 10^{5} \mathrm{~m}^{2} & \\
\mathrm{Q}_{\mathrm{CP}}=\frac{\mathrm{A} \times \mathrm{DDIR}}{\mathrm{E}_{\mathrm{a}}}=\frac{5.027 \times 10^{5} \times 7.6 \times 10^{-3}}{0.7}=1.516 \mathrm{~m}^{3} / \mathrm{s} &
\end{array}
$$

Maximum time of irrigation $\leq \frac{\mathrm{RAW}}{\mathrm{DDIR}} \leq \frac{40}{7.6} \leq 126.316 \cong 126 \mathrm{hr}$

$$
\mathrm{A}_{\mathrm{p}}=\frac{60 \times \mathrm{Q}_{\mathrm{CP}}}{\mathrm{R} \times \mathrm{R}_{\mathrm{e}}}=\frac{60 \times 1.516}{400 \times 14} \times 100=1.624 \mathrm{~cm} / \mathrm{min}
$$

$\mathrm{S}_{\mathrm{r}} \leq \frac{\mathrm{D}_{\mathrm{m}}}{\mathrm{DDIR}} \leq \frac{18}{7.6} \leq 56.842 \rightarrow$ acceptable rotational velocity is less than56 hours in each rotation
$\mathrm{q}_{\mathrm{r}}=\frac{2 \times \mathrm{R}_{\mathrm{e}}}{\mathrm{R}} \times \mathrm{Q}_{\mathrm{s}}=\frac{2 \times 14}{400} \times 1.516 \times 60=6.4 \mathrm{~m}^{3} / \mathrm{min}$
$A_{r}=\pi \times R_{e}{ }^{2}=\pi \times 142=615 \mathrm{~m}^{2}$
$v_{r}=\frac{q_{r}}{A_{r}}=\frac{6.4}{615}=0.01 \mathrm{~m} / \mathrm{min}$
5. According to the table, determine preference of limited available water to obtain maximum production per unit area in May and June.

| Month | March | April | May | June | July | August |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Growth stage |  |  |  |  |  |  |
| Corn | Plant <br> establishment | Chlorophyll | Flowering | Product formation |  |  |
| Cotton | Plant <br> establishment | Chlorophyll | Flowering | Flowering | Product formation | Reach |
| Sunflower | Plant <br> establishment | Chlorophyll | Chlorophyll | Flowering | Product formation |  |
| $\mathbf{k}_{\mathbf{y}}$ |  |  |  |  |  |  |
| Corn | 0.4 | 0.4 | 1.5 | 0.5 | 0.5 | 0.25 |
| Cotton | 0.2 | 0.2 | 0.5 | 0.5 | 0.8 |  |
| Sunflower | 0.25 | 0.25 | 0.5 | 1.0 |  |  |

$\frac{\mathrm{Y}_{\mathrm{a}}}{\mathrm{Y}_{\mathrm{m}}}=1-\mathrm{k}_{\mathrm{y}} \times\left(1-\frac{\mathrm{ET}_{\mathrm{a}}}{E T_{\mathrm{w}}}\right)$
According to the formula, while $\mathrm{k}_{\mathrm{y}}$ increase, right side of the formula will decrease that it will show production decreasing. Therefore, in May, since $\mathrm{k}_{\mathrm{y}}$ of corn is more than other plants, preference of limited available water is for corn and in June, since $\mathrm{k}_{\mathrm{y}}$ of sunflower is more than other plants, preference of limited available water is for it.
6. Determine Richards' equation in an anisotropic porous media using Darcy's law and the formula.
$\phi \frac{\partial \mathrm{S}}{\partial \mathrm{t}}=-\left(\frac{\partial \mathrm{q}_{\mathrm{x}}}{\partial \mathrm{x}}+\frac{\partial \mathrm{q}_{\mathrm{x}}}{\partial \mathrm{y}}+\frac{\partial \mathrm{q}_{\mathrm{z}}}{\partial \mathrm{z}}\right)+\mathrm{Q}$
$\mathrm{v}_{\mathrm{x}}=\mathrm{k}_{\mathrm{x}} \frac{\partial \phi}{\partial \mathrm{x}} \quad \mathrm{v}_{\mathrm{y}}=\mathrm{k}_{\mathrm{y}} \frac{\partial \phi}{\partial \mathrm{y}} \quad \mathrm{v}_{\mathrm{z}}=\mathrm{k}_{\mathrm{z}} \frac{\partial \phi}{\partial \mathrm{z}} \quad \mathrm{Q}=\phi \frac{\partial \mathrm{S}}{\partial \mathrm{t}}+\mathrm{S} \frac{\partial \mathrm{v}_{\mathrm{x}}}{\partial \mathrm{x}}+\mathrm{S} \frac{\partial \mathrm{v}_{\mathrm{y}}}{\partial \mathrm{y}}+\mathrm{S} \frac{\partial \mathrm{v}_{\mathrm{z}}}{\partial \mathrm{z}}$
$\mathrm{C}(\phi) \frac{\partial \phi}{\partial \mathrm{t}}=\frac{\partial}{\partial \mathrm{x}}\left(\mathrm{k}_{\mathrm{x}} \frac{\partial \phi}{\partial \mathrm{x}}\right)+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{k}_{\mathrm{y}} \frac{\partial \phi}{\partial \mathrm{y}}\right)+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{k}_{\mathrm{z}} \frac{\partial \phi}{\partial \mathrm{z}}\right)-\frac{\mathrm{q}}{\mathrm{dxdydz}}$
7. According to the table (related to the corn), if irrigation efficiency is 40 percent and performance ratio is $\mathbf{7 0}$ percent, determine optimum irrigated area.

| Growth stage | Plant establishment | Chlorophyll | Flowering | Product fo |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Time (day) | 25 | 30 | 30 | 38 |  |
| $\mathrm{ET}_{\mathrm{m}}$ (mm/day) | 3.6 | 6.4 | 9.5 | 7.2 |  |
| Available water ( $\mathrm{m}^{3}$ ) | 130000 | 240000 | 260000 | 370000 |  |
| $\mathrm{k}_{\mathrm{y}}$ | 0.4 | 0.4 | 1.5 | 0.5 |  |
| $\begin{aligned} & \mathrm{T}_{1}=25 \text { days } \\ = & 3.6 \mathrm{~mm} / \text { day } \end{aligned}$ | $\mathrm{T}_{2}=30$ days |  | $\mathrm{T}_{3}=30$ days | $\mathrm{T}_{4}=38$ days | $E T_{\text {m1 }}$ |
| $=130000 \mathrm{~m} 3 \mathrm{~m}_{\mathrm{m} 2}$ | $.4 \mathrm{~mm} /$ day | $\mathrm{ET}_{\mathrm{m} 3}=9.5 \mathrm{~mm} /$ day |  | $\mathrm{ET}_{\mathrm{m} 4}=7.2 \mathrm{~mm} /$ day | V1 |

$$
\begin{aligned}
& \mathrm{V}_{2}=240000 \mathrm{~m} 3 \quad \mathrm{~V}_{3}=260000 \mathrm{~m} 3 \quad \mathrm{~V}_{4}=370000 \mathrm{~m} 3 \quad \mathrm{~K}_{\mathrm{y} 1}=0.4 \\
& \mathrm{~K}_{\mathrm{y} 2}=0.4 \quad \mathrm{~K}_{\mathrm{y} 3}=1.5 \quad \mathrm{~K}_{\mathrm{y} 4}=0.5 \quad \mathrm{E}=40 \% \quad \frac{\mathrm{Y}_{\mathrm{a}}}{\mathrm{Y}_{\mathrm{m}}}=70 \% \\
& \frac{Y_{a}}{Y_{m}}=1-k_{y} \times\left(1-\frac{E T_{a}}{E T_{w}}\right) \\
& \mathrm{ET}_{\mathrm{a} 1}=\frac{\mathrm{V}_{1} \times \mathrm{E}}{100 \times \mathrm{A}_{1} \times \mathrm{T}_{1}} \times 1000=\frac{130000 \times 40 \times 1000}{100 \times \mathrm{A}_{1} \times 25}=\frac{2.08 \times 10^{6}}{\mathrm{~A}_{1}} \\
& 1-0.7=0.4 \times\left(1-\frac{5.778 \times 10^{5}}{\mathrm{~A}_{1}}\right) \rightarrow \mathrm{A}_{1} \cong 231 \text { ha } \\
& \mathrm{ET}_{\mathrm{a} 2}=\frac{\mathrm{V}_{2} \times \mathrm{E}}{100 \times \mathrm{A}_{2} \times \mathrm{T}_{2}} \times 1000=\frac{240000 \times 40 \times 1000}{100 \times \mathrm{A}_{2} \times 30}=\frac{3.2 \times 10^{6}}{\mathrm{~A}_{2}} \\
& 1-0.7=0.4 \times\left(1-\frac{5 \times 10^{5}}{\mathrm{~A}_{2}}\right) \rightarrow \mathrm{A}_{2}=200 \mathrm{ha} \\
& \mathrm{ET}_{\mathrm{a} 3}=\frac{\mathrm{V}_{3} \times \mathrm{E}}{100 \times \mathrm{A}_{3} \times \mathrm{T}_{3}} \times 1000=\frac{260000 \times 40 \times 1000}{100 \times \mathrm{A}_{3} \times 30}=\frac{3.467 \times 10^{6}}{\mathrm{~A}_{3}} \\

$$

Maximum irrigated area is related to the plant establishment stage ( 231 ha ), however optimum irrigated area is calculated as follows:
$A=\operatorname{Min}\{A 1, A 2, A 3, A 4\}=\operatorname{Min}\{231,200,46,135\}=46$ ha
Due to high value of ky3 and for achievement to relative performance (70\%), 46 hectares from area can only be irrigated as optimum in flowering stage.
8. In a basin irrigation system, infiltration equation is $Z=6 T^{0.5}$ ( $T$ as min and $Z$ as millimeter), discharge in width unit is 0.000286 cubic meters per second per meter, available discharge for irrigation is 0.00283 cubic meters per second, there is not runoff, basin width is $\mathbf{6}$ meters, requirement effective storage in root depth is $\mathbf{1 0 0}$ millimeters,

## OMICBGeBooks

and final infiltration after 4 hours (when water reach to the end of basin) is $\mathbf{1 0}$ millimeters per hour. Determine length of basin, irrigation time, and average deep percolation.

$$
\mathrm{q}=0.286 \times 10^{-3} \frac{\mathrm{~m}^{3}}{\mathrm{~s} . \mathrm{m}} \quad \mathrm{Q}=0.00283 \mathrm{~m}^{3} / \mathrm{s} \quad \text { Runoff }=0 \quad \mathrm{w}=6 \mathrm{~m} \quad \mathrm{Dr}=100 \mathrm{~mm}

34. Two tensiometers have been established in depths of 40 and 80 centimeters, Gauged pressures by them are 60 and 120 centimeters, respectively. Value of rainfall is 10 millimeters per day in study area. Determine soil hydraulic conductivity.

$$
\mathrm{R}=\mathrm{k} \frac{\Delta \phi}{\Delta \mathrm{~L}} \rightarrow 10=\mathrm{k} \frac{120-60}{80-40} \rightarrow \mathrm{k}=6.667 \mathrm{~mm} / \text { day }
$$

35. In an irrigated area, evapotranspiration is 1655 millimeters per year, deep percolation is 695 millimeters per year, and ${L R_{r}=140 ~ m m . ~ E l e c t r i c a l ~ c o n d u c t i v i t y ~}_{\text {m }}$ for irrigation water is 1.75 millimhoses per centimeter, soil saturation extract is 3.5 millimhoses per centimeter, and $\mathrm{EC}_{\mathrm{p}}=7.0 \mathrm{mmhos} / \mathrm{cm}$. Determine $\mathrm{LR}_{\mathrm{i}}$ and leaching percentage.

## OMICEGERooks <br> Group

$\mathrm{ET}=1655 \mathrm{~mm} \quad \mathrm{R}=695 \mathrm{~mm} \quad \mathrm{ECi}=1.75 \mathrm{mmhos} / \mathrm{cm}$
$\mathrm{ETR}_{\mathrm{c}}=\mathrm{R}-\mathrm{LR}_{\mathrm{r}}=695-140=555 \mathrm{~mm}$
$\mathrm{I}_{\mathrm{c}}=\mathrm{ET}-\mathrm{R}_{\mathrm{c}}=1655-555=1100 \mathrm{~mm}=\left(\mathrm{I}_{\mathrm{c}}+\mathrm{LR}_{\mathrm{i}}\right) \times \mathrm{EC}_{\mathrm{i}}=\left(1100+\mathrm{LR}_{\mathrm{i}}\right) \times 1.75$
$\mathrm{LR} \times \mathrm{EC}_{\mathrm{p}}=\left(\mathrm{LR}_{\mathrm{i}}+\mathrm{LR}_{\mathrm{r}}\right) \times \mathrm{EC}_{\mathrm{p}}=\left(\mathrm{LR}_{\mathrm{i}}+140\right) \times 7=7 \mathrm{LR}_{\mathrm{i}}+980$
$925+1.75 \mathrm{LR}_{\mathrm{i}}=7 \mathrm{LRi}+980 \rightarrow \mathrm{LR}_{\mathrm{i}}=180 \mathrm{~mm}$
$\mathrm{I}=\mathrm{I}_{\mathrm{c}}+\mathrm{LR}_{\mathrm{i}}=1100+180=1280 \mathrm{~mm}$
$\mathrm{LR}=\frac{\mathrm{LR}_{\mathrm{i}}}{\mathrm{I}} \times 100=\frac{180}{1280} \times 100=14 \%$
36. Determine evapotranspiration using below information and the figures:

Rainfall (during 24 hours) $=0 \mathbf{~ m m}$
$K$ pan $=0.75$

---------------- bottom of pann-
-.-----------
$\mathrm{ET}_{\mathrm{o}}=\mathrm{K}$ pan $\times \mathrm{E}$ pan
$\mathrm{E}_{\mathrm{pan}}=150-144=6 \mathrm{~mm} /$ day
$\mathrm{ET}_{\mathrm{o}}=0.75 \times 6=4.5 \mathrm{~mm} /$ day
37. Determine evapotranspiration using below information:

Water depth in pan on day $1=411 \mathrm{~mm}$
Water depth in pan on day $2=409 \mathbf{m m}$ (after 24 hours)
Rainfall (during 24 hours) = $\mathbf{7 m m}$
$K_{\text {pan }}=0.90$
$E T_{o}=K_{p a n} \times E_{p a n}$
$\mathrm{E}_{\mathrm{pan}}=411-409+7=9 \mathrm{~mm} /$ day
$\mathrm{ET}_{\mathrm{o}}=0.90 \times 9=8.1 \mathrm{~mm} /$ day
38. Given:

Latitude - $35^{\circ}$ North
Mean T max in April $=29.5^{\circ} \mathrm{C}$
Mean T min in April $=19.4^{\circ} \mathrm{C}$
Find: Determine for the month April the mean ET in mm/day using the BlaneyCriddle method
$E T_{o}=p\left(0.46 \mathrm{~T}_{\mathrm{o}}\right.$ mean +8$)$

Step 1: determine T mean:
$\mathrm{T}_{\text {mean }}=\frac{\mathrm{T}_{\text {max }}+\mathrm{T}_{\text {min }}}{2}=\frac{29.5+19.4}{2}=24.5^{\circ} \mathrm{C}$

Step 2: determine p:
$\mathrm{p}=0.29$
Step 3: calculate $\mathrm{ET}_{\mathrm{o}}: \mathrm{ET}_{\mathrm{o}}=0.29(0.46 \times 24.5+8)=5.6 \mathrm{~mm} /$ day
Thus the mean reference crop evapotranspiration $\mathrm{ET}_{\mathrm{o}}=5.6 \mathrm{~mm}$ /day during the whole month of April.
39. Estimate the duration of the four growth stages for the following crops: cotton (190 days), lentils ( 160 days), sweet maize ( 100 days), potatoes ( 130 days), tomatoes/ transplanted ( 140 days from transplant).

| Crop | Initial stage | Crop dev. Stage (days) | Mid-season stage (days) | Late season stage |
| :--- | :--- | :--- | :--- | :--- |
| Cotton (190- days) | 30 | 50 | 60 | 50 |
| Lentils (160 days) | 25 | 30 | 65 | 40 |
| Sweet maize (100 days) | 20 | 30 | 40 | 10 |

| Potatoes (130 days) | 30 | 35 | 40 | 25 |
| :--- | :--- | :--- | :--- | :--- |
| Tomatoes/transplanted (140 days from <br> transplant) | 15 | 40 | 60 | 25 |

## 40. Determine the crop water need of tomatoes using the figure:

| Month | Jan | Feb Mar | Apr | May | June | July |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ET $^{(m m m}$ (day) | 4.0 | 5.05 .8 | 6.3 | 6.8 | 7.1 | 6.5 |
| Humidity | medium | $(60 \%)$ |  |  |  |  |
| Windspeed | medium | $(3 \mathrm{~m} / \mathrm{sec})$ |  |  |  |  |
| Duration of growing period (from sowing): 150 days |  |  |  |  |  |  |
| Planting date: 1 February (direct sowing) |  |  |  |  |  |  |

Step 1: Estimate the duration of the various growth stages

| Crop | Total growing <br> period (days) | Initial stage | Crop dev. stage | Mid-season stage | Late season stage |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Tomatoes | 150 | 35 | 40 | 50 | 25 |

## Step 2: The ETo values and the duration of the growth stages.

Note: When calculating the crop water needs, all months are assumed to have 30 days. For the calculation of the reference crop evapotranspiration, the actual number of days of each month is used e.g., January 31 days, February 28 or 29 days, etc.

Crop: tomatoes planting date: 1 February

| Months | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ET $_{\boldsymbol{o}}(\mathbf{m m} /$ <br> day $)$ | 4.0 | 5.0 | 5.8 | 6.3 | 6.8 | 7.1 | 6.5 |  |  |  |  |  |
| Growth <br> stages |  | Initial st | Crop dev st | Mid-season at | Late s. st |  |  |  |  |  |  |  |

| Planting date | 1Feb |
| :--- | :--- |
| Initial stage, $\mathbf{3 5}$ days | 1 Feb-5 Mar |
| Crop development stage, 50 days | 6 Mar- 15 Apr |
| Mid-season stage, 50 days | 16 Apr- 5 Jun |
| Late season stage, 25 days | 6 Jun- 30 Jun |
| Last day of the harvest | 30 Jun |

## Step 3: Estimate the Kc factor for each of the 4 growth stages

$\mathrm{K}_{\mathrm{c},}$, initial stage $=0.45$
$\mathrm{K}_{\mathrm{c},}$ crop development stage $=0.75$
$\mathrm{K}_{\mathrm{c},}$ mid-season stage $=1.15$
$\mathrm{K}_{\mathrm{c},}$, late season stage $=0.8$
It can be seen from the table above that the months and growth stages do not correspond. As a consequence the $\mathrm{ET}_{\mathrm{o}}$ and the $\mathrm{K}_{\mathrm{c}}$ values do not correspond.
Yet the ET crop ( $=\mathrm{ET}_{\mathrm{o}} \times \mathrm{K}_{\mathrm{c}}$ ) has to be determined on a monthly basis. It is thus necessary to determine the $\mathrm{K}_{\mathrm{c}}$ on a monthly basis, which is done as follows:

## (1) $\frac{\mathscr{O} \text { ebooks }}{}$ Group

February: $\mathrm{K}_{\mathrm{c}} \mathrm{Feb}=0.45$
March: 5 days: $\mathrm{K}_{\mathrm{c}}=0.45$, 25 days: $\mathrm{Kc}=0.75$

$$
\mathrm{Kc}_{\text {March }}=\frac{5}{30} \times 0.45+\frac{25}{30} \times 0.75=0.07+0.62 \cong 0.70
$$

April: 15 days: $\mathrm{Kc}=0.75,15$ days: $\mathrm{Kc}=1.15$

$$
\mathrm{Kc}_{\text {April }}=\frac{15}{30} \times 0.75+\frac{15}{30} \times 1.15=0.38+0.58 \cong 0.95
$$

May: Kc, May $=1.15$

June: 5 days: $\mathrm{Kc}=1.15,25$ days: $\mathrm{Kc}=0.80$

$$
\mathrm{Kc}_{\text {June }}=\frac{5}{30} \times 1.15+\frac{25}{30} \times 0.80=0.19+0.67 \cong 0.85
$$

Step 4: Calculate, on a monthly basis, the crop water need, using the formula:
ET crop $=\mathrm{ET}_{\mathrm{o}} \times \mathrm{Kc}(\mathrm{mm} /$ day $)$
February: ET crop $=5.0 \times 0.45=2.3 \mathrm{~mm} /$ day
March: ET crop $=5.8 \times 0.70=4.1 \mathrm{~mm} /$ day
April: ET crop $=6.3 \times 0.95=6.0 \mathrm{~mm} /$ day
May: ET crop $=6.8 \times 1.15=7.8 \mathrm{~mm} /$ day
June: ET crop $=7.1 \times 0.85=6.0 \mathrm{~mm} /$ day

## Step 5: Calculate the monthly and seasonal crop water needs.

Note: all months are assumed to have 30 days.
February: ET crop $=30 \times 2.3=69 \mathrm{~mm} /$ month
March: ET crop $=30 \times 4.1=123 \mathrm{~mm} /$ month
April: ET crop $=30 \times 6.0=180 \mathrm{~mm} /$ month
May: ET crop $=30 \times 7.8=234 \mathrm{~mm} /$ month
June: ET crop $=30 \times 6.0=180 \mathrm{~mm} /$ month
The crop water need for the whole growing season of tomatoes is 786 mm .

## 41. Calculate the effective rainfall for the following monthly rainfall figures: $P=35$, $90,116,5,260,75 \mathrm{~mm}$

| $\mathbf{P}(\mathbf{m m} / \mathbf{m o n t h} \mathbf{0}$ | Formula | $\mathbf{P e} \mathbf{( m m / m o n t h})$ |
| :---: | :---: | :---: |
| 35 | $\mathrm{Pe}=0.6 \mathrm{P}-10$ | 1 |
| 90 | $\mathrm{Pe}=0.8 \mathrm{P}-25$ | 47 |
| 116 | $\mathrm{Pe}=0.8 \mathrm{P}-25$ | 68 |
| 5 | $\mathrm{Pe}=0.6 \mathrm{P}-10$ | 0 |
| 260 | $\mathrm{Pe}=0.8 \mathrm{P}-25$ | 183 |
| 75 | $\mathrm{PE}=0.8 \mathrm{P}-25$ or $0.6 \mathrm{P}-10$ | 35 |

42. Calculate the irrigation water need (IN) of paddy rice for the month of April when given:

- $\mathbf{E T}_{\text {o }}=6 \mathrm{~mm} /$ day
- Kc = 1.1
- the root zone has already been saturated in the previous month
- $\operatorname{PERC}=5 \mathrm{~mm} /$ day
- the water layer ( 100 mm ) needs to be established during April
- $\mathbf{P e}=135 \mathrm{~mm} /$ month
$\mathrm{IN}=\mathrm{ET}$ crop $+\mathrm{SAT}+\mathrm{PERC}+\mathrm{WL}-\mathrm{Pe}$
ET crop $=\mathrm{ET}_{\mathrm{o}} \times \mathrm{Kc}=6 \times 1.1=6.6 \mathrm{~mm} /$ day $=6.6 \times 30=198 \mathrm{~mm} / \mathrm{month}$
$\mathrm{SAT}=0 \mathrm{~mm}$
PERC $=5 \mathrm{~mm} /$ day $=5 \times 30=150 \mathrm{~mm} / \mathrm{month}$
$\mathrm{WL}=100 \mathrm{~mm}$
$\mathrm{Pe}=135 \mathrm{~mm} / \mathrm{month}$
$\mathrm{IN}=198+0+150+100-135=313 \mathrm{~mm} / \mathrm{month}=10.4 \mathrm{~mm} /$ day
Thus the irrigation water need during April is 313 mm or $10.4 \mathrm{~mm} /$ day .

43. The base period, duty of water and area under irrigation for various crops under a canal system are given in the figure. If the losses in the reservoir and canals are respectively $15 \%, 25 \%$, determine the reservoir capacity.

| Crop | Wheat | Sugar cane | Cotton | Rice | V. table |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Base period B (days) | 120 | 320 | 180 | 120 | 120 |
| Duty, D (ha/cumec) | 1800 | 1600 | 1500 | 800 | 700 |
| Area irrigated (ha) | 15000 | 10000 | 5000 | 7500 | 5000 |

Total volume of water 47,910 ha-m
Volume at head of canal $=\frac{47910}{0.75}=63880 \mathrm{ha}-\mathrm{m}$
Volume of reservoir $=\frac{63880}{0.85}=75150$ ha -m
44. Determine the consumptive use for wheat from the following data by BlaneyCriddle method. Take K=0.7

| Month | nov | dec | Feb |
| :---: | :---: | :---: | :---: | :---: |
| Mean temperature, oC, $\mathbf{T}_{\boldsymbol{m}}$ | 20 | 16 | 14 |
| \% month day light hrs, P | 7.19 | 7.15 | 7.3 |

For the month of November

$$
\begin{aligned}
& \mathrm{f}=\mathrm{P} \times \frac{4.6 \mathrm{~T}_{\mathrm{m}}+81.3}{100}=7.19 \times \frac{4.6 \times 20+81.3}{100}=12.46 \\
& \mathrm{u}=\mathrm{kf}=0.7 \times 12.46=8.72 \mathrm{~cm}
\end{aligned}
$$

Likewise, the values of $u$ for months Dec., Jan. and Feb. are computed as 7.75, 7.44 and 7.40 cm respectively. Thus, seasonal consumptive use,

$$
\mathrm{U}=\sum_{\mathrm{i}=1}^{4} \mathrm{u}_{\mathrm{i}}=8.72+7.75+7.44+7.40=31.31 \mathrm{~cm}
$$

## 45. Estimate the potential evapo-transpiration for a crop for the month of June using the Thornthwaite equation from the following data.

| Month | Apr | May | June | july | Aug | Sep | Oct |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Temp, $\mathbf{T}_{\mathbf{m}}$ ( $\mathbf{0 C}$ ) | 4.5 | 12.5 | 20.4 | 20.2 | 21.5 | 10.5 | 5.5 |
| Max sun shine hrs | 370 | 380 | 365 | 358 | 355 | 350 | 345 |

Step 1: Obtain the monthly heat index, i
Step 2: Calculate the annual heat index, I
Step 3: Determine the constants a \& b and finally estimate PET for each month. The monthly heat index is determined as:
$\mathrm{i}=\left(\frac{\mathrm{T}_{\mathrm{m}}}{5}\right)^{1.514}$

| Month | Apr | May | June | July | Aug | Sep | Oct |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Heat index i | 0.85 | 4.00 | 8.40 | 8.28 | 9.10 | 3.07 | 1.16 |
| Factor B | 1.03 | 1.06 | 1.01 | 0.99 | 0.99 | 0.97 | 0.96 |

$\mathrm{a}=1.051 \mathrm{a}$
$\mathrm{b}=1.01 \mathrm{~b}$

Then potential evapotranspiration for the month June is given by:
PET $=1.6 \mathrm{~b}\left(\frac{10 \mathrm{~T}_{\mathrm{m}}}{\mathrm{I}}\right)^{\mathrm{a}}=1.6 \times 1.01 \times\left(\frac{10 \times 20.4}{34.86}\right)^{1.051}=10.35 \mathrm{~cm}$
46. Given the wind, speed at 3 m height is $250 \mathrm{~km} /$ day; calculate the wind function $f(\mathrm{U})$ by applying the correction factor for the wind speed.

U (applying correction) $=0.93 \times 250=232 \mathrm{~km} /$ day
$f(u)=0.90$
Or
$\mathrm{f}(\mathrm{u})=0.27 \times\left(1+\frac{\mathrm{U}_{2}}{100}\right)$
47. Determine evapotranspiration using below information:
$\mathrm{W}=0.77$
$\mathbf{R n}=6.6$
$\mathrm{f}(\mathrm{u})=0.9$
$e_{a}-e_{d}=17.5$
C=1.01
$\mathrm{ET}_{\mathrm{o}}=1.01(0.77 \times 6.6+0.23 \times 0.9 \times 17.5)=8.8 \mathrm{~mm} /$ day
48. A stream size of 150 lit / sec was released from the diversion headwork to irrigate a land of area 1.8 hectares. The stream size when measured at the delivery to the field channels is $1201 i t / s e c$. The stream continued for $h$ hours. The effective root zone depth is 1.80 m . The application losses in the field are estimated to be $440 \mathrm{~m}^{3}$. The depth of water penetration was 1.80 m and 1.20 m at the head and tail of the run respectively. The available water holding capacity of the soil is $21 \mathrm{~cm} / \mathrm{m}$ and irrigation was done at $60 \%$ depletion of Am. Find $E_{c}, E_{f}, E_{a}, E_{s}$ and $E_{d}$. The stream size delivered to the plot was 100 lit/sec.
$\mathrm{E}_{\mathrm{c}}=\frac{\mathrm{W}_{\mathrm{f}}}{\mathrm{W}_{\mathrm{d}}} \times 100=\frac{120}{150} \times 100=80 \% \mathrm{E}_{\mathrm{f}}=\frac{\mathrm{W}_{\mathrm{p}}}{\mathrm{W}_{\mathrm{f}}} \times 100=\frac{100}{120} \times 100=83.3 \%$
Water delivered to the plot $=\frac{100 \times 60 \times 60 \times 8}{1000}=2880 \mathrm{~m}^{3}$

## OMICSGBoisp

Water stored in the root zone = Water delivered to the plot - Application loss
Water stored in the root zone $=2880-2440 \mathrm{~m} 3$
$\mathrm{E}_{\mathrm{a}}=\frac{\mathrm{W}_{\mathrm{s}}}{\mathrm{W}_{\mathrm{p}}} \times 100=\frac{2440}{2880} \times 100=84.7 \%$
Total A.M. $=\frac{21 \mathrm{~cm}}{\mathrm{~m}} \times 1.80 \mathrm{~m}=37.80 \mathrm{~cm}$
$R A M=\frac{60}{100} \times 37.80=22.68 \mathrm{~cm}$
$R A M=\frac{22.68}{100} \times 1.8 \times 10^{4}=4082.4 \mathrm{~m}^{3}$
$\mathrm{E}_{\mathrm{s}}=\frac{\mathrm{W}_{\mathrm{s}}}{\mathrm{W}_{\mathrm{n}}} \times 100=\frac{2440}{4082.4}=59.8 \% \cong 60 \%$
Average water penetration $=\mathrm{d}=\frac{1.8+1.2}{2}=1.5 \mathrm{~m}$
Numerical deviation at upper end $=1.8-1.5=0.3 \mathrm{~m}$
Numerical deviation at lower end $=1.5-1.2=0.3 \mathrm{~m}$
Average numerical deviation $=\frac{2 \times 0.3}{2}=0.3 \mathrm{~m}$

$$
E_{d}=100\left(1-\frac{y}{d}\right)=100\left(1-\frac{0.3}{1.5}\right)=80 \%
$$

49. A crop has in effective root zone of $120 \mathrm{~cm}(1.20 \mathrm{~m})$ prior to irrigation; soil samples were taken from different depths to determine the moisture status of the soil.

| Depth of root zone $(\mathrm{m})$ | Weight of soil sample (gm) | Weight of oven dry soil (g) |
| :---: | :---: | :---: |
| $0-0.30$ | 98.80 | 94.60 |
| $0.30-0.60$ | 96.60 | 92.10 |
| $0.60-0.90$ | 95.00 | 90.60 |
| $0.90-1.20$ | 94.00 | 89.40 |

The water holding capacity of the soil at field capacity is $19.60 \mathrm{~cm} /$ meter. The apparent specific gravity of the soil is 1.60 . Determine the moisture content in the root zone at different depths total depth of water available in the root zone at different depths, total depth of water available in the root zone and the soil moisture deficit.

For depth from 0-0.3 m:
Mass of water $=98.8-94.6=4.2 \mathrm{gm}$

## (1) ${ }^{\text {eb }}$ Books <br> Group

Moisture content $=\mathrm{W}=\frac{4.2}{94.6} \times 100=4.44 \%$
In depth of water
$\mathrm{d}=\mathrm{A}_{\mathrm{s}} \mathrm{D}_{\mathrm{p}}=1.6 \times 0.3 \times 0.0444=0.0213 \mathrm{~m}=2.13 \mathrm{~cm}$
For depth 0.3-0.6 m:
Mass of Water $=96.6-92.1=4.5 \mathrm{gm}$
Moisture content $=\mathrm{W}=\frac{4.5}{92.1} \times 100=4.88 \%$
In depth of water
$\mathrm{d}=\mathrm{A}_{\mathrm{s}} \mathrm{D}_{\mathrm{p}}=1.6 \times 0.3 \times 0.0488=0.0234 \mathrm{~m}=2.34 \mathrm{~cm}$
For depth 0.6-0.9 m:
Mass of Water $=95.0-90.6=4.4$ gm
Moisture content $=W=\frac{4.4}{90.6} \times 100=4.86 \%$
In depth of water
$\mathrm{d}=\mathrm{A}_{\mathrm{s}} \mathrm{D}_{\mathrm{p}}=1.6 \times 0.3 \times 0.0486=0.0233 \mathrm{~m}=2.33 \mathrm{~cm}$
For depth 0.9-1.2 m:
Mass of Water $=94.0-89.4=4.6 \mathrm{gm}$
Moisture content $=\mathrm{W}=\frac{4.6}{89.4} \times 100=5.14 \%$
In depth of water
$\mathrm{d}=\mathrm{A}_{\mathrm{s}} \mathrm{D}_{\mathrm{p}}=1.6 \times 0.3 \times 0.0514=0.0247 \mathrm{~m}=2.47 \mathrm{~cm}$
The total depth of water in the root zone is the total of all the water retained at different depths.

Total depth $=\sum_{i=1}^{4} d_{i}=2.13+2.34+2.33+2.47=9.27 \mathrm{~cm}$
Water retained at field capacity $=19.6 \times 1.2=23.52 \mathrm{~cm}$
Water in the root zone $=19.6 \times 1.2=23.52 \mathrm{~cm}$
The soil moisture deficit prior to irrigation is therefore,
FC - depth of water during sampling $=23.52-9.27=14.25 \mathrm{~cm}$
This deficit is the amount of water, which should be added to the soil to bring the soil moisture content to field capacity. Thus, it represents the depth of irrigation. Assuming that the peak rate of consumptive use during the stage of the plant is $8 \mathrm{~mm} /$ day

$$
\mathrm{i}=\frac{\text { depth }}{\text { peack cu }}=\frac{142.5}{8}=17.8 \text { days } \rightarrow \mathrm{i}=17 \text { days }
$$

The next watering will be done after 17 days. The interval should not be made 18 days, because the plant may suffer shortage of water for one day.
50. In an agricultural area high water table occur. A subsurface drainage system is to be installed to control the water table under the following conditions:

Design discharge rate is $1 \mathrm{~mm} / \mathrm{d}$;
The depth of the water table midway between the drains is to be kept a 1.0 m below the ground surface.

Drains will be installed at a depth of 2 m ;
PVC drainpipes with a radius of 0.10 m will be used
A deep auguring revealed that there is a layer of low conductivity at 6.8 m , which can be regarded as the base of the flow region. Auger-hole measurements were made to calculate the hydraulic conductivity of the soil above the impervious layer. Its average value was found to be $0.14 \mathrm{~m} / \mathrm{d}$.

If we assume a homogeneous soil profile, we can use the Hooghoudt Equation to calculate the drain spacing. We have the following data:
$\mathrm{Q}=1 \mathrm{~mm} / \mathrm{d}=0.001 \mathrm{~m} / \mathrm{d}$
$h=2.0-1.0=1.0 \mathrm{~m}$
$\mathrm{r} 0=0.10 \mathrm{~m}$
$\mathrm{K}=0.14 \mathrm{~m} / \mathrm{d}$
$\mathrm{D}=6.8-2.0=4.8 \mathrm{~m}$
Substitution of the above values into Hooghoudt equation yields

$$
L^{2}=\frac{8 K d h+4 K h^{2}}{q}=\frac{8 \times 0.14 \times d \times 1+4 \times 0.14 \times 1^{2}}{0.001}=1120 d+560
$$

As the equivalent depth, d , is a function of L (among other things), we can only solve this quadratic equation for $L$ by trial and error.

First estimate: $\mathrm{L}=75 \mathrm{~m}$. We can determine the equivalent depth, d using the equation given above
$\Rightarrow \mathrm{d}=3.40$
Thus, $\mathrm{L}^{2}=1120 \times 3.40+560=4368 \mathrm{~m}^{2}$. This is not in agreement with $\mathrm{L}^{2}=75^{2}=5625 \mathrm{~m}^{2}$. Apparently, the spacing of 75 m is too wide.

Second estimate: L, $=50 \mathrm{~m}$.
=> d $=2.96$
Thus $\mathrm{L}^{2}=1120 \times 2.96+560=3875 \mathrm{~m}^{2}$. This is not in agreement with $\mathrm{L}^{2}=502=2500 \mathrm{~m}^{2}$.

Thus, spacing of 50 m is too narrow.
Third estimate: $\mathrm{L}=65 \mathrm{~m}$
=> d =3.22
Thus $\mathrm{L}^{2}=1120 \times 3.22+560=4171 \mathrm{~m}^{2}$. This is sufficiently close to $\mathrm{L}^{2}=65^{2}=4225 \mathrm{~m}^{2}$.
Therefore, we can select a spacing of 65 m .
51. A trial configuration of a hand- move sprinkler system has a lateral running down slope form a mainline along a constant grade of $0.005 \mathrm{~m} / \mathrm{m}$. the design operating pressure of the nozzle is 310 kpa . The trial length of the lateral results in a distance of 400 m between the first and the last sprinkler. Determine maximum allowable head loss to friction as $\mathbf{m} / \mathrm{m}$.
$H_{a}=\frac{P}{\rho g}=\frac{310 \times 10^{3}}{10^{3} \times 9.81}=31.61 \mathrm{~m}$
Since the elevation decreases along the lateral, the increase in elevation is -ve
$H_{e}=-s \times 1=-.005 \times 400=2 \mathrm{~m}$
Setting the allowable pressure difference between the critical sprinklers equal to $20 \%$.
$H_{c}=\frac{0.2 \times 31.61-2}{400} 400=0.021 \mathrm{~m} / \mathrm{m}$
52. Calculate the specific capacity of an open well from the following data,

Initial depression head $=5 \mathbf{~ m}$
Final depression head $=2 \mathbf{~ m}$
Time of recuperation $=\mathbf{2} \mathbf{~ h r}$
Diameter of well $=3 \mathbf{~ m}$
Calculate also the specific yield and yield of the well under head of 3 m .
$A=\frac{\pi}{4} \times 3^{2}=7.07 \mathrm{~m}^{2}$
$\mathrm{T}=2 \mathrm{hr} \quad \mathrm{H}_{1}=5 \mathrm{~m} \mathrm{H}_{2}=2 \mathrm{~m} \mathrm{H}=3 \mathrm{~m}$
$K=\frac{2.303 \times A}{T} \log \left[\frac{H_{1}}{H_{2}}\right]=\frac{2.303 \times 7.07}{2} \log \left[\frac{5}{2}\right]=3.24 \mathrm{~m}^{3} / \mathrm{hr} /$ unit head

So, the specific capacity is $3.24 \mathrm{~m}^{3} / \mathrm{hr} /$ unit head

Specific yield $=\frac{K}{A}=\frac{3.24}{7.07}=\frac{0.458 \frac{m^{3}}{h r}}{m^{2}}$ Yield of well $=\mathrm{Q}=\mathrm{K} \mathrm{X} \mathrm{H}=3.24 \times 3=9.72 \mathrm{~m}^{3} / \mathrm{hr}$
53. Find the diameter of an open well to give the discharge of $31 / \mathrm{s}$. The depression head is 3 m and specific yield is $1 \mathrm{~m}^{3} / \mathrm{hr} / \mathrm{m}^{2}$.
$Q=K H=\frac{K}{A} A H \frac{K}{A}=\frac{1 \frac{m^{3}}{h r}}{m^{2}}$
$A=\frac{\pi}{4} \times d^{2}($ assuming the diameter of well as $d m)$
$H=3 \mathrm{~m}$
$Q=3 \frac{l}{s}=\frac{3 \times 60 \times 60}{1000}=10.8 \frac{\mathrm{~m}^{3}}{\mathrm{hr}}$
$10.8=1 \times \frac{\pi}{4} \times d^{2} \times 3 \rightarrow d=2.14 m$
54. A channel is to be designed for irrigation 5000 hectares in Kharif crop and 4000 hectares in Rabi crop. The water requirement for Kharif and Rabi are 60 cm and 25 cm , respectively. The Kor period for Kharif is 3 weeks and for Rabi is 4 weeks. Determine the discharge of the channel for which it is to be designed.
$\mathrm{n}=\frac{8.64 \times B}{D}=60 \mathrm{~cm}$
$\mathrm{B}=3$ weeks $=21$ days
Duty $=\frac{8.64 \times 21}{0.6}=302.4 \frac{\mathrm{ha}}{\mathrm{m}^{3}}$
Area to be irrigated $=5000 \mathrm{ha}$
Required discharge of channel $=\frac{5000}{302.4}=16.53 \mathrm{~m}^{3} / \mathrm{s} \Delta=25 \mathrm{~cm}$
$B=4$ weeks $=28$ days
Duty $=\frac{8.64 \times 28}{0.25}=967.684 \frac{\mathrm{ha}}{\mathrm{m}^{3}}$
Area to be irrigated $=4000$ ha
Required discharge of channel $=\frac{4000}{967.68}=4.13 \mathrm{~m}^{3} / \mathrm{s}$
So, the channel is to be designed for the maximum discharge of $16.53 \mathrm{~m}^{3} / \mathrm{s}$, because this discharge capacity of the channel will be able to supply water to both the seasons.

## 55. Given:

IF $=0.5$
$e_{d}=80 \%$
$\mathrm{Q}_{\mathrm{u}}=0.005 \mathrm{~m}^{3} / \mathrm{s}$
$I_{n}=100 \mathrm{~mm}$
$\mathrm{N}=0.15$

## Find:

$\mathrm{T}_{\mathrm{n}}, \mathrm{L}, \mathrm{T}_{\mathrm{co}}$, and $\mathrm{d}_{\text {max }}$
$T_{n}=\left[\frac{i_{n}-c}{a}\right]^{\frac{1}{b}}=\left[\frac{100-7}{1.196}\right]^{\frac{1}{0.748}}=337 \mathrm{~min}$
$\frac{T_{t}}{T_{n}}=0.58 \rightarrow T_{t}=195 \mathrm{~min}$
$L=\frac{6 \times 10^{4} \times Q_{u} \times T_{t}}{\frac{a\left(T_{t}\right)^{b}}{1+b}+c+1798 n^{\frac{3}{8}}\left(Q_{u}\right)^{\frac{9}{16}}\left(T_{t}\right)^{\frac{3}{16}}}$
$L=\frac{6 \times 10^{4} \times 0.005 \times 195}{\frac{1.196(195)^{0.748}}{1+0.748}+7+1798 \times 0.15^{\frac{3}{8}}(0.005)^{\frac{9}{16}}(195)^{\frac{3}{16}}}=359 \mathrm{~m}$
$T_{c o}=\frac{i_{n} L}{600 Q_{u} \times e_{d}}=\frac{100 \times 359}{600 \times 0.005 \times 80}=150 \mathrm{~min}$
$d_{\max }=2250 n^{\frac{3}{8}}\left(Q_{u}\right)^{\frac{9}{16}}\left(T_{t}\right)^{\frac{3}{16}}=2250 \times 0.15^{\frac{3}{8}}(0.005)^{\frac{9}{16}}(195)^{\frac{3}{16}}=151 \mathrm{~mm}$
56. Given:

```
IF=0.5
in}=100\textrm{mm
S=0.001 m/m
n=0.15
e
d max }=150\textrm{mm
```

$\mathrm{L}=250 \mathrm{~m}$
Crop=Alfalfa

## Find:

$T_{n}, T_{r l}, \mathbf{Q}_{\mathrm{u}}, \mathbf{T}_{\mathrm{co}}$, and $\mathbf{d}_{\mathrm{h}}$
$T_{n}=\left[\frac{i_{n}-c}{a}\right]^{\frac{1}{b}}=\left[\frac{100-7}{1.196}\right]^{\frac{1}{0.748}}=337 \min Q_{u}=\frac{0.00167 i_{n} L}{\left(T_{n}-T_{r l}\right) e_{d}}=\frac{0.00167 \times 100 \times 250}{\left(337-T_{r l}\right) 70}$
$\mathrm{T}_{\mathrm{r} 1}=17 \mathrm{~min} \rightarrow \mathrm{Q}_{\mathrm{u}}=0.00186 \mathrm{~m}^{2} / \mathrm{s}$

$e_{d}=100 \frac{i_{n}}{i_{g}}=100 \frac{75}{127}=59 \%$
59. Given: ${ }^{g}$
$\mathrm{S}=0.005 \mathrm{~m} / \mathrm{m}$
$\mathrm{P}=310 \mathrm{kPa}$
$\mathrm{L}=400 \mathrm{~m}$

## Find:

$H_{L}$ in a sprinkle irrigation system

$$
\begin{aligned}
& \mathrm{H}_{\mathrm{a}}=\frac{\mathrm{P}}{\tilde{n} g}=\frac{\frac{310000}{1000}}{9.81}=31.61 \mathrm{~m} \\
& \mathrm{H}_{\mathrm{e}}=-\mathrm{Sl}=-0.005 \times 400=-2 \mathrm{~m} \\
& \mathrm{H}_{\mathrm{L}}=\frac{\square \mathrm{H} \times \mathrm{H}_{\mathrm{a}}-\mathrm{H}_{\mathrm{e}}}{1}=\frac{0.2 \times 31.61-(-2)}{400}=0.021 \mathrm{~m} / \mathrm{m}
\end{aligned}
$$

60. The figure gives the details for a certain crop. Using Blaney-Cridle equation and a crop factor $k=0.75$, determine the following (i) consumptive use, (ii) consumptive irrigation requirement, (iii) field irrigation requirement, if water application efficiency is 0.7 . The latitude of the place is $30^{\circ} \mathrm{N}$.

| Month (1) | Monthly tepm (Av.) oC (2) | Monthly \% of day time hours of <br> the year (3) | Useful rain fall (cm) (4) |
| :--- | :--- | :--- | :--- |
| Nov. | 19.0 | 7.19 | - |
| Dec. | 16.0 | 7.15 | 1.2 |
| Jan. | 12.5 | 7.30 | 0.8 |
| Feb. | 13.0 | 7.03 | - |

The monthly temperature and useful rainfall data are average values for the last 10 years. The consumptive use is computed from the Blany-Criddle equation:
$\mathrm{C}_{\mathrm{u}}=\mathrm{k} \sum \mathrm{f}$
Where

$$
f=\frac{p}{40}[1.8 t+32]
$$

| Month (1) | to C (2) | p\% (3) | F (4) |
| :--- | :--- | :--- | :--- |
| Nov | 19.0 | 7.19 | 11.90 |
| Dec | 16.0 | 7.15 | 10.9 |
| Jan | 12.5 | 7.30 | 9.9 |

| Feb | 13.0 | 7.03 | 9.7 |
| :--- | :--- | :--- | :--- |
|  |  | $\sum \mathrm{f}=42.4$ |  |

$C_{u}=0.75 \times 42.4=31.8 \mathrm{~cm}$
$R_{e}=1.2+0.8=2 \mathrm{~cm}$
$\mathrm{CIR}=\mathrm{C}_{\mathrm{u}}-\mathrm{R}_{\mathrm{e}}=31.8-2=29.8 \mathrm{~cm}$
NIR $=$ CIR (since on water is used for deep percolation)
$F I R=\frac{N I R}{\eta_{a}}=\frac{29.8}{0.7}=42.6 \mathrm{~cm}$
61. The figure shows the map of Cauvery basin with rainfall observations in $\mathbf{c m}$ of water marked at various rain gauge stations. Compute the average rainfall by (1) Arithmetic average method (2) Isohyetal, method and (3) Thiessen Polygon method.

(i) Arithmetic Average Method: It is clear from the figure that stations having gauge reading as 53,81 , and 68 are located outside the basin. Hence they are not included in taking the arithmetical average.

Average rainfall $=70$
Arithmetic mean $=\frac{1}{9}(58+71+69+86+84+56+69+79+61)=70.34 \mathrm{~cm}$

## 1MICGEBooks <br> roup

(ii) Isohyetal method: The isohyets are drawn, just as contours, as shown in the figure. Area between adjacent isohyets is determined by a planimeter.
$P_{a v}=\frac{\sum A \frac{\left(P_{1}+P_{2}\right)}{2}}{\sum A}=\frac{2121.2}{40.40} \cong 69 \mathrm{~cm}$
(iii) Thiessen Polygon Method. Area of each polygon is determined by planimeter.

| Area of Thiessein polygon $\mathbf{A} \mathbf{( c m}^{\mathbf{2}} \mathbf{)}$ | Observed precipitation $\mathbf{P} \mathbf{( c m )}$ | Product A x P |
| :---: | :---: | :---: |
| 3.26 | 58 | 189.0 |
| 0.39 | 63 | 24.6 |
| 1.61 | 71 | 114.2 |
| 2.04 | 69 | 140.8 |
| 2.46 | 86 | 211.5 |
| 0.84 | 81 | 68.0 |
| 3.91 | 84 | 328.5 |
| 5.09 | 56 | 285.0 |
| 0.41 | 53 | 217.5 |
| 3.94 | 69 | 272.0 |
| 2.06 | 61 | 125.7 |
| 4.40 | 79 | 347.5 |
| Sum 30.41 |  | 2324.3 |

$P_{a v}=\frac{\sum A P}{\sum A}=\frac{2324.3}{33.41}=76.4 \mathrm{~m}$
62. A precipitation station $X$ was inoperative for some time during which a storm occurred. The storm totals at three stations $A, B$, and $C$ surrounding $X$, were respectively $6.60,4.80$, and 3.70 cm . The normal annual precipitation amounts at stations $X, A, B$, and $C$ are respectively $65.6,72.6,51.8$, and 38.2. Estimate the storm precipitation for station $P$.

If $N_{X}, N_{A}, N_{B}$, and $N_{C}$ are the average annual precipitation amounts at $X, A, B$, and $C$ and $P_{A}$, $P_{B}$, and $P_{C}$ are the storm totals of stations $A, B$, and $C$ surrounding $X$, the storm precipitation at station X is given by.

$$
P_{X}=\frac{1}{3}\left[\frac{N_{X}}{N_{A}} \times P_{A}+\frac{N_{X}}{N_{B}} \times P_{B}+\frac{N_{X}}{N_{C}} \times P_{C}\right]
$$

If storm precipitations at four stations surrounding the faulty stations $X$ are known and annual precipitations of all the five are known, the average precipitation at X during the storm is given by

$$
\begin{aligned}
& P_{X}=\frac{1}{4}\left[\frac{N_{X}}{N_{A}} \times P_{A}+\frac{N_{X}}{N_{B}} \times P_{B}+\frac{N_{X}}{N_{C}} \times P_{C}+\frac{N_{X}}{N_{D}} \times P_{D}\right] \\
& P_{X}=\frac{1}{3}\left[\frac{65.6}{72.6} \times 6.6+\frac{65.6}{51.8} \times 4.8+\frac{65.6}{38.2} \times 3.7\right]=6.11 \mathrm{~cm}
\end{aligned}
$$

63. A 12-hour storm rainfall with the following depths in cm occurred over a basin:

## $2.0,2.5,7.6,3.8,10.6,5.0,7.0,10.0,6.4,3.8,1.4$, and 1.4

The surface run-off resulting from the above storm is equivalent to $25.5 \mathbf{~ c m}$ of depth over the basin. Determine the average infiltration index for the basin.

Total rainfall in 12 hours $=2.0+2.5+7.6+3.8+10.6+5.0+7.0+10.0+6.4+3.8+1.4+1.4=61.5$
Total run-off in 12 hours $=25.5 \mathrm{~cm}$
Total infiltration in 12 hours=61.5-25.5=36 cm
Average infiltration $=36 / 12=3 \mathrm{~cm} / \mathrm{hr}$.
It will be observed from the above data that rainfall is less than average infiltration in $1^{\text {st }}$, $2^{\text {nd }}, 11^{\text {th }}$, and $12^{\text {th }}$, hour. Hence during these hours, rate of infiltration will be equal to the rainfall. In the central period, the rainfall is more than infiltration.

Hence if f is the average rate of infiltration during the central 8 hours, we have
$8 \mathrm{f}+2+2.5+1.4+1.4=36 \rightarrow \mathrm{f}=3.6 \mathrm{~cm} / \mathrm{hr}$
64. From the storm data given in below:
$2.0,2.5,7.6,3.8,10.6,5.0,7.0,10.0,6.4,3.8,1.4$, and 1.4
Determine the average depth of hourly rainfall excess for a basin of area of 120

## OMICSGroup

hectares. The basin consists $A_{1}, A_{2}$, and $A_{3}$ having average infiltration indices given below:

| Area designation | A1 | A2 | A3 |
| :--- | :--- | :--- | :--- |
| Area (hectares) | 20 | 40 | 60 |
| Infiltration Index $(\mathrm{cm} / \mathrm{hr})$ | 7.6 | 3.8 | 1.0 |

The run-off coming out from the individual areas $\mathrm{A}_{1}, \mathrm{~A}_{2}$, and $\mathrm{A}_{3}$ will have to be spread over the entire basin and hence its depth will be reduced.
65. The figure gives flood data for 16 years recorded at the Bhakra Dam site on Sutlej River:

| Year | Discharge (cumes) | year | Discharge (cumes) |
| :--- | :--- | :--- | :--- |
| 1937 | 3110 | 1944 | 2290 |
| 1938 | 5800 | 1945 | 2380 |
| 1939 | 3090 | 1946 | 3810 |
| 1940 | 1723 | 1947 | 7800 |
| 1941 | 3630 | 1948 | 4525 |
| 1942 | 6600 | 1949 | 3254 |
| 1943 | 5260 | 1950 | 4980 |
|  | 1951 | 9200 |  |

Find out the recurrence interval for the flood of various magnitudes by the following methods: (i) California method, (ii) Hazen's method, and (iii) Gumbel's method.
The recurrence interval has been calculated by the three methods. The value of C for Gumbel's method has been taken by $\mathrm{N}=15$.
66. A well fully penetrating a confined aquifer is pumped at a uniform rate of 2500 liters per minute. The drawdown in an observation well situated at 60 m away is given in the figure. Determine the formation constants of the aquifer.

| Time since pumping began $\mathbf{t}$ <br> $\mathbf{( m i n )}$ | Drawdown s(min) | $\mathbf{t}(\mathbf{m i n})$ | $\mathbf{s}(\mathbf{m})$ | $\mathbf{t}(\mathbf{m i n})$ | $\mathbf{s}(\mathbf{m})$ |

67. A saddle siphon has the following data:

## Full reservoir level=435 m

## Level of centre of siphon outlet= 429.6 m

High flood level=435.85 m
High flood discharge $=600$ cumecs.
If the dimensions of the throat of the siphon are: with=4 $\mathbf{m}$ and height= $\mathbf{2} \mathbf{~ m}$ determine the number of siphon units required to pass the flood safety.
The siphon discharge freely in air.
Maximum operative head $=\mathrm{H}=\mathrm{H}$. F. L. - R. L. of outlet centre
$H=435.85 \times 429.6=6.25 \mathrm{~m}$
The discharge is given by
$\mathrm{Q}=\mathrm{CA} \sqrt{2 \mathrm{gH}}=0.95 \times 4 \times 2 \times \sqrt{2 \times 9.81 \times 6.25}=57.8$ cumecs .
Number of units required $=\frac{600}{57.8}=11$
68. For the following data, calculate the total available water and soilmoisture deficit.

| Soil depth $(\mathrm{cm})$ | $\mathrm{G}_{\mathrm{b}}$ | $\mathrm{W}_{\mathrm{fc}}$ | $\mathrm{W}_{\mathrm{wp}}$ | W |
| :---: | :---: | :---: | :---: | :---: |
| $0-15$ | 1.25 | 0.24 | 0.13 | 0.16 |
| $15-30$ | 1.30 | 0.28 | 0.14 | 0.18 |
| $30-60$ | 1.35 | 0.31 | 0.15 | 0.23 |
| $60-90$ | 1.40 | 0.33 | 0.15 | 0.26 |
| $90-120$ | 1.40 | 0.31 | 0.14 | 0.28 |

| Depth of soil layers d (mm) | $\mathrm{w}_{\mathrm{fc}}=\mathrm{G}_{\mathrm{b} .} . \mathrm{W}_{\mathrm{fc}}$ | $\mathrm{w}_{\mathrm{wp}}=\mathrm{G}_{\mathrm{b} .} \mathbf{W}_{\text {wp }}$ | $\begin{aligned} & \mathbf{W}_{\mathrm{t}}=\left(\mathrm{w}_{\mathrm{fc}}-\mathrm{w}_{\mathrm{wp}}\right) \mathrm{d} \\ & (\mathrm{~mm}) \end{aligned}$ | $\mathbf{w}=\mathrm{G}_{\mathrm{b} .} \mathbf{W}$ | $\mathrm{D}_{\mathrm{s}}=\left(\mathrm{w}_{\mathrm{fc}}-\mathrm{w}\right) \mathrm{d}(\mathrm{mm})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 150 | 0.3 | 0.1625 | 20.625 | 0.2 | 15.0 |
| 150 | 0.364 | 0.182 | 27.300 | 0.234 | 19.5 |
| 300 | 0.4185 | 0.2025 | 64.800 | 0.3105 | 32.4 |
| 300 | 0.462 | 0.21 | 75.600 | 0.364 | 29.4 |
| 300 | 0.434 | 0.196 | 71.400 | 0.392 | 12.6 |
|  |  | total | 259.725 |  | 108.9 |

Total available water $=259.725 \mathrm{~mm} \cong 260 \mathrm{~mm}$
Soil moisture deficit $=108.9 \mathrm{~mm} \cong 109 \mathrm{~mm}$
69. The culturable command area for a distributary channel is 15000 hectares. The intensity of irrigation is $35 \%$ for wheat and $20 \%$ for rice. The kor period for wheat and rice are 4 and 3 weeks, respectively. The kor watering depths for wheat and rice are 135 and 190 mm , respectively. Estimate the distributary discharge.

Since the water demands for wheat and rice are at different times, these are not cumulative. Therefore, the distributary channel should be designed for higher of the two values, i.e., $3.14 \mathrm{~m}^{3} / \mathrm{s}$.
70. A ground water basin consists of 20 km 2 of plains. The maximum fluctuation of ground water table is 3 m , assuming a specific yield of $15 \%$, determine the available ground water storage.

Available ground water storage $=$ Area of basin x depth of fluctuation x specific yield $=20 \times 10^{6} \times 3 \times 0.15=9 \times 10^{6} \mathrm{~m}^{3}$
71. In an aquifer whose area is 100 ha , the water table dropped by 3 m . Assuming porosity and specific retention of the aquifer material as 305 and $10 \%$ respectively, determine the specific yield of the aquifer and the change in ground water storage.

Porosity $=$ Specific yield + specific retention
Specific yield $=$ Porosity - specific retention $=30-10=20 \%$
Reduction in ground water storage $=100 \times 10^{4} \times 3 \times 0.2=60 \times 10^{4} \mathrm{~m}^{3}$
72. A soil sample was taken with a core samples from a field when soil reached field capacity. The oven dry sample weighed 1.065 kg . The inside diameter of the core was 7.5 cm and the length was 15 cm . Determine the bulk density and the apparent specific gravity of the soil.
The volume of the core $=\pi \mathrm{r}^{2} \mathrm{~h}=\frac{22}{7} \times 3.75 \times 3.75 \times 15=663 \mathrm{~cm}^{3}$
$\mathrm{r}=3.75 \mathrm{~cm} \quad \mathrm{~h}=15 \mathrm{~cm}$
Weight of even dry sample $=1.065 \mathrm{~kg}=1065 \mathrm{~g}$
The bulk density of the soil $=\frac{1065}{663}=1.61 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$

## OMIGeBooks Group

The apparent specific gravity $=1.61$
73. Calculate the (a) bulk density, (2) water content on weight basis (mass wetness) and (c) water content on volume basis (volume wetness) of a soil when a soil core of 10 cm diameter and 8 cm length weighs 1113.14 g immediately after sampling and 980.57 g after oven drying at $105^{\circ} \mathrm{C}$.
(a) Volume of the soil core $=\pi \mathrm{r}^{2} \mathrm{~h}=\pi \times\left(\frac{10}{2}\right)^{2} \times 8=628.57 \mathrm{~cm}^{3}$

Bulk density $=\mathrm{Bd}=\frac{980.57}{628.57}=1.56 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$
(b) Water content on weight basis $=\frac{\text { Weight of fresh core }- \text { Weight of oven dry core }}{\text { Weight of oven dry soil core }}$

$$
P_{w}=\frac{1113.14-980.57}{980.57} \times 100=13.52 \%
$$

(c) Water content on volume basis $=P_{v}=P_{w} \times B d=13.52 \times 1.56=21.09 \%$
74. Find out the particle density of a soil from the following data:
(i) Weight of an empty $100 \mathrm{~cm}^{3}$ pycnometer $\left(\mathrm{W}_{1}\right)$ is 33.3 g
(ii) Weight of pycnometer+oven dry soil $\left(\mathrm{W}_{2}\right)$ is 53.33 g
(iii) Weight of the ptcnometer+soil+water making the total volume to $100 \mathrm{~cm}^{3}\left(\mathrm{~W}_{3}\right)$ is 145.78 g
(iv) Weight of the pycnometer filled with 100 cc soil $\left(\mathrm{W}_{4}\right)$ is 133.3 g
(v) Density of water $\left(\rho_{\mathrm{w}}\right)$ is $1 \mathrm{~g} / \mathrm{cm}^{3}$

Particle density $=\mathrm{Pd}=\frac{\text { Oven dry weight of soil sample }}{\text { Volume of water displaced by soil sample }}=\frac{\tilde{\mathrm{n}}_{\mathrm{w}\left(\mathrm{w}_{2}-\mathrm{W}_{1}\right)}}{\left(\mathrm{W}_{4}-\mathrm{W}_{1}\right)-\left(\mathrm{W}_{3}-\mathrm{W}_{2}\right)}$
$\operatorname{Pd}=\frac{1 \times(53.5-33.3)}{(133.3-33.3)-(145.78-53.3)}=\frac{200}{100-92.48}=2.66 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$
75. Calculate the total porosity of a soil when the particle density is $2.65 \mathrm{~g} / \mathrm{cm}^{3}$ and the bulk density of soil is $1.56 \mathbf{g} / \mathbf{c m}^{3}$.

Particle density of the soil $=\mathrm{Pd}=2.65 \mathrm{gr} / \mathrm{cm}^{2}$
Bulk density of the soil $=\mathrm{Bd}=1.56 \mathrm{~g} / \mathrm{cm}^{3}$
Prosity of the soil $=\mathrm{E}=\left(1-\frac{\mathrm{Bd}}{\mathrm{Pd}}\right) \times 100=\left(1-\frac{1.56}{2.65}\right) \times 100=41.13 \%$
76. A soil sample was drawn with a core sampler having an inside dimension of 10 cm diameter and 5 cm length. The fresh and oven dry weights of the soil core were 700 g and 625 g respectively. Calculate the bulk density of soil and soil water content on volume basis.

Volume of the soil core $=\pi \times 25 \times 5=392.5 \mathrm{~cm}^{3}$
Soil water content $=\mathrm{Pw}=(700-625) \times \frac{100}{625}=12 \%$
Bulk density of the soil $=\frac{625}{392.5}=1.59 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$
Soil water content on volume basis $=P v=12 \times 1.59=10.08 \%$
77. The volume of water present in a $395 \mathrm{~cm}^{3}$ soil core is 75 ml . The oven dry weight of the soil core is $\mathbf{6 2 5}$ g. Calculate the soil water content on weight basis.

Bulk density of the soil $=\frac{\text { Oven dry weight of soil core }}{\text { Volume of soil core }}=\frac{625}{395}=1.58 \mathrm{~g} / \mathrm{cm}^{3}$

Soil water content on volume basis $=\frac{\text { Volume of water }}{\text { Volume of soil core }} \times 100=\frac{75}{395} \times 100=19 \%$
Soil water content on weight basis $=\frac{\text { Soil water content on volume basis }}{\text { Bulk density of soil }}$
Soil water content on weight basis $=\frac{19}{1.58}=12.03 \%$
78. A $663 \mathrm{~cm}^{3}$ soil core taken by a core samples from a field weighed 1.065 kg on oven drying. True specific gravity of the soil was 2.65 . Determine the porosity of the soil.

The bulk density of the soil $=\frac{1.065}{663}=1.6 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$

The true specific gravity $=2.65$
Porosity of the soil $=1-\frac{1.6}{2.65}=0.396$
79. Calculate the maximum water holding capacity of a soil from the following data of Keen-Raczkowski measurements.
(i) Weight of brass box+Filter paper (a) $=77.25$
(ii) Weight of the brass box+Filter paper+Oven-dry soil (c)= 140.27 g
(iii) Weight of the brass box+Filter paper+Saturated soil (b) $=161.2 \mathrm{~g}$
(iv) Water content of the filter paper (d) $=0.35 \mathrm{~g}$

Maximum water holding capacity $=$ MWHC $=\frac{b-c-d}{c-a} \times 100$

$$
\text { MWHC }=\frac{161.2-140.27-0.35}{140.27-77.25} \times 100=\frac{20.58}{63.02} \times 100=32.65 \%
$$

80. A soil core was drawn with a core sampler having an inside dimension of $5 \mathbf{c m}$ diameter and 15 cm length from a field two days after irrigation when the soil water was near field capacity. The weight of the core sampler with fresh soil sample was 1.95 kg and the weight of the same on oven drying was 1.84 kg . The empty core sampler weighted 1.4 kg . Calculate the (a) bulk density of soil, (b) water holding capacity of soil in per cent on volume basis and (c) depth of water held per meter depth of soil.

Weight of the moist soil core $=1.95-1.4=0.55 \mathrm{~kg}$
Weight of the oven dry soil core $=1.84-1.4=0.44 \mathrm{~kg}$
Soil water content $=\frac{0.55-0.44}{0.44} \times 100=\frac{0.11}{0.44} \times 100=25 \%$
(a) Volume of the soil core $=\pi r^{2} h=\pi \times 2.52 \times 15=294.64 \mathrm{~cm}^{3}$
(b) Water holding capacity of the soil $=$ Soil water content on weight basis x Bulk density $=$ $25 \times 1.51=37.75 \%$
(c) Water holding capacity of the soil per meter depth of soil $=37.75 \mathrm{~cm}$
81. Find out the height to which water would rise in a capillary tube of 0.06 mm diameter when the surface tension is 72 dynes $/ \mathrm{cm}$ at $20^{\circ} \mathrm{C}$. The density of water is $\mathbf{1 g /}$ cm3 and the value of $\cos \theta$ is assumed as 1 .

Radius of the capillary tube $(\mathrm{R})=0.03 \mathrm{~mm}$
Surface tension $=\sigma=72$ dynes $/ \mathrm{cm}$
Acceleration due to gravity $=\mathrm{g}=981$ dynes $/ \mathrm{cm}$
Density of water $=\rho_{\mathrm{w}}=1 \frac{\mathrm{~g}}{\mathrm{~cm}^{3}}$ Density of water $=\rho_{\mathrm{w}}=1 \mathrm{~g} / \mathrm{cm}^{2}$
$\cos \theta=1$

$$
\mathrm{h}=\frac{2 \sigma \cos \theta}{\mathrm{~g} \rho \mathrm{r}}=\frac{2 \times 72 \times 1}{981 \times 1 \times 0.003}=48.93 \mathrm{~cm}
$$

82. A permeameter of 40 cm diameter discharges 1.5 lit of water in 30 min . The soil was packed to depth of 45 cm and a constant head of 15 cm was maintained. Determine the hydraulic conductivity.
$\mathrm{Q}=1500 \mathrm{~cm}^{3}$
$\mathrm{L}=45 \mathrm{~cm}$
$\mathrm{t}=30 \mathrm{~min}=0.5 \mathrm{hr}$
$\Delta \mathrm{H}=45+15=60 \mathrm{~cm}$
$\mathrm{A}=\pi \mathrm{r}^{2}=\pi \times 20^{2}=1257.14 \mathrm{~cm}^{2}$

Hydraulic conductivity $=\mathrm{K}=\frac{1500 \times 45}{1257.14 \times 0.5 \times 60}=1.79 \frac{\mathrm{~cm}}{\mathrm{hr}}$
83. Find out the water content of a soil on weight and volume basis just before irrigation from the following data. The thermo-gravimetric method is followed for determination of the water content.
(i) Weight of the empty aluminium box $\left(\mathrm{W}_{1}\right)=35.23 \mathrm{~g}$
(ii) Weight of the aluminum box+ fresh soil sample $\left(\mathrm{W}_{2}\right)=95.33 \mathrm{~g}$
(iii) Weight of oven dry soil+ box $\left(\mathrm{W}_{3}\right)=85.12 \mathrm{~g}$
(iv) Density of water $\left(\rho_{\mathrm{w}}\right)=1 \mathrm{~g} / \mathrm{cm}^{3}$
(v) Bulk density of the soil $=1.54 \mathrm{~g} / \mathrm{cm}^{3}$

Weight of the fresh soil sample $=\mathrm{W}_{2}-\mathrm{W}_{1}=95.33-35.23=60.1 \mathrm{~g}$
Weight of water in the soil sample $=\mathrm{W}_{2}-\mathrm{W}_{3}=95.33-85.12=10.21 \mathrm{~g}$
Weight of the oven - dry soil $=85.12-35.23=49.89 \mathrm{~g}$
Soil water content $=\frac{\text { Weight of soil water }}{\text { Weight of oven }- \text { dry soil } \times \text { density of water }} \times 100=\frac{10.21}{49.89 \times 1} \times 100=20.47 \%$
Soil water content $=$ Soil water content on weight basis x bulk density
Soil water content $=\mathrm{Pw} \times \mathrm{Bd}=2047 \times 1.54=31.52 \%$
84. Calculate the Hg column reading expected in a manometer attached to a tensiometer installed at 30 cm depth in an experimental field to study the effect of irrigations at $0.4,0.5,0.6,0.7$, and 0.8 atmospheric tensions on a wheat crop. The mercury level in the manometer cup is 10 cm above the ground. Density of mercury is $13.6 \mathrm{~g} / \mathrm{cm}^{3}$.

The gravitational head $=\mathbf{Z}=$
Level of Hg in the manometer cup + depth at which tensiometer installed = $10+30$ $=40 \mathrm{~cm}$

The manometer reading above the Hg surface in the cup at soil saturation $=\frac{40}{13.6}=2.94 \mathrm{~cm}$

Mercury reading at a desired tension $=$ mercury reading at 1 atm x desired atm.tension + mercury reading at soil saturation

Mercury reading at 0.4 atm. tension $=76 \times 0.4+2.94=33.34 \mathrm{~cm}$
Mercury reading at 0.5 atm.tension $=76 \times 0.5+2.94=40.94 \mathrm{~cm}$
Similarly, the Hg height at $0.6,0.7$, and 0.8 atm . Tension would be $48.54,56.14$, and 63.74 cm respectively.
85. On a summer day, net solar energy received at a lake reaches 15 MJ per square meter per day. If $\mathbf{8 0 \%}$ of the energy is used to vaporize water, how large could the depth of evaporation be?
$1 \mathrm{MJm}-2$ day- $1=0.408 \mathrm{~mm} /$ day
$0.8 \times 15 \times 0.408=4.9 \mathrm{~mm} /$ day
The evaporation rate could be $4.9 \mathrm{~mm} /$ day .
86. Determine the atmospheric pressure and the psychometric constant at an elevation of 1800 m .

$$
\begin{aligned}
& z=1800 \mathrm{~m} \\
& \mathrm{P}=101.3\left[\frac{293-0.0065 \times 1800}{293}\right]^{5.26}=81.8 \mathrm{kPa} \\
& \gamma=0.665 \times 10^{-3} \times 81.8=0.054 \mathrm{kPa} /{ }^{\circ} \mathrm{C}
\end{aligned}
$$

87. The daily maximum and minimum air temperature are respectively 24.5 and $15^{\circ} \mathrm{C}$. Determine the saturation vapor pressure for that day.

$$
\begin{aligned}
& \mathrm{e}^{\circ}\left(\mathrm{T}_{\max }\right)=0.6108 \exp \left[\frac{17.27 \times 24.5}{24.5+237.3}\right]=3.075 \mathrm{kPa} \\
& \mathrm{e}^{\circ}\left(\mathrm{T}_{\min }\right)=0.6108 \exp \left[\frac{17.27 \times 15}{15+237.3}\right]=1.705 \mathrm{kPa} \mathrm{e}_{\mathrm{s}}=\frac{3.075+1.705}{2}=2.39 \mathrm{kPa}
\end{aligned}
$$

Note that for temperature $19.75^{\circ} \mathrm{C}$ (which is $\operatorname{Tmean}$ ), $\mathrm{e}^{\circ}(\mathrm{T})=2.30 \mathrm{kPa}$
The mean saturation vapor pressure is 2.39 kPa .
88. Determine the vapor pressure from the readings of an aspirated psychomotor in a location at an elevation of 1200 m . The temperatures measured by the dry and wet bulb thermometers are 25.6 and $19.5^{\circ} \mathrm{C}$ respectively.

```
\(z=1200 \mathrm{~m}\)
\(\mathrm{P}=87.9 \mathrm{kPa}\)
\(\mathrm{T}_{\text {wet }}=19.5^{\circ} \mathrm{C}\)
\(\mathrm{e}_{\mathrm{o}}\left(\mathrm{T}_{\text {wet }}\right)=2.267 \mathrm{kPa}\)
\(\mathrm{a}_{\text {psy }}=2.267-0.000662 \times 87.9 \times(25.6-19.5)=1.91 \mathrm{kPa}\)
```

89. Given the following daily minimum and maximum air temperature and the corresponding relative humidity data:

$$
\begin{aligned}
T_{\min } & =18^{\circ} \mathrm{C} \text { and } \text { RHmax }=82 \% \\
T_{\text {max }} & =25^{\circ} \mathrm{C} \text { and } \text { RHmin }=54 \%
\end{aligned}
$$

Determine the actual vapor pressure.

$$
\begin{aligned}
& \mathrm{T}_{\min }=18^{\circ} \mathrm{C} \\
& \mathrm{e}_{\mathrm{o}}\left(\mathrm{~T}_{\min }\right)=2.064 \mathrm{kPa} \\
& \mathrm{~T}_{\max }=25^{\circ} \mathrm{C} \\
& \mathrm{e}_{\mathrm{o}}\left(\mathrm{~T}_{\max }\right)=3.168 \mathrm{kPa} \\
& e_{a}=2.064 \frac{82}{100}+3.168 \frac{54}{100}=1.70 \mathrm{kPa}
\end{aligned}
$$

90. Given: Suppose a measurement of the air gave the temperature ( T ) to be $80^{\circ} \mathrm{F}$ and the relative humidity ( RH ) to be $\mathbf{6 0 \%}$.

Compute: a) the saturated vapor pressure ( $\mathrm{e}^{\circ}$ )
b) The actual vapor pressure (e)
c) The dew point temperature ( $\mathrm{T}_{\mathrm{d}}$ ).
a) Calculation of saturated vapor pressure $\mathbf{e}^{\circ}$
$e^{\circ}=\left(\frac{1648+80}{157}\right)^{8}=34.9 \mathrm{mb}$
b) Calculation of the actual vapor pressure e
$R H=\frac{e}{e^{\circ}} \times 100$
$e=e^{\circ} \frac{R H}{100}=34.9 \frac{60}{100}=20.9 \mathrm{mb}$
c) Calculation of the dew point temperature $T_{d}$
$\mathrm{T}_{\mathrm{d}}=157 \times 20.9^{0.125}-164.8=64.8^{\circ} \mathrm{F}$
91. Given: Suppose a total wind run of 300 miles per day was measured with an anemometer located 3 meters above the soil surface. In this area, the average daytime to nighttime wind speeds ratio is about 2 . The grass at the weather station is maintained at 6 inches tall.

## Compute:

a) The daily wind runs for a height of 2 meters.
b) The average daytime wind speed.
a) The wind adjustment factor $\left(U_{f}\right)$ for these conditions is 0.92 . Then the wind run at 2 m would be computed from:
$\mathrm{U}_{2 \mathrm{~m}}=\mathrm{U}_{\mathrm{f}} \mathrm{U}_{3 \mathrm{~m}}=0.92 \times 300=276 \mathrm{miles} /$ day
b) $U_{d}=0.056 \times 276=15.3 \mathrm{miles} / \mathrm{hr}$
92. Given: Assume crop coefficient $\left(K_{c}\right)=1.0$ for this period. Pan coefficient $\left(K_{p}\right)=$ 0.75 .

## Daily evaporation from a Class $A$ evaporation pan, in/d

| Year |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Find: Determine the peak $\mathrm{ET}_{\mathrm{c}}$ rate for design.
Example calculation for day 1 of year 1 :
$\mathrm{ET}_{\mathrm{o}}=\mathrm{K}_{\mathrm{p}} \mathrm{E}_{\mathrm{pan}}=0.75 \times 0.64=0.48 \mathrm{in} /$ day
$E T_{c}=\mathrm{K}_{\mathrm{c}} \mathrm{ET}_{\mathrm{o}}=1.0 \times 0.48=0.48 \mathrm{in} /$ day
The resulting daily $\mathrm{ET}_{\mathrm{c}}$ for the crop is:

| Daily crop evapotranspiration, in/d |  |  |  |  |  |  |  |  |  |  |

## 93. Given:

$\mathrm{I}_{\mathrm{F}}=0.5$
$F_{\mathrm{n}}=4$ in
$s_{0}=0.001 \mathrm{ft} / \mathrm{ft}$
$\mathrm{n}=0.15$
$\mathrm{E}=65 \%$
$\mathrm{L}=650 \mathrm{ft}$
Find:
$\mathbf{Q}_{\mathrm{u}}$ and $\mathrm{T}_{\mathrm{a}}$
$\mathrm{T}_{\mathrm{n}}=328 \mathrm{~min}$
$\mathrm{T}_{\mathrm{L}}=8$ to 20 min
Assume $\mathrm{T}_{\mathrm{L}}=14 \mathrm{~min}$
$\mathrm{Q}_{\mathrm{u}}=\frac{\mathrm{LF}_{\mathrm{n}}}{7.2\left(\mathrm{~T}_{\mathrm{n}}-\mathrm{T}_{\mathrm{L}}\right) \mathrm{E}}=\frac{650 \times 4}{7.2(328-14) 65}=0.018 \frac{\mathrm{ft}^{3}}{\mathrm{~s}} \rightarrow \mathrm{~T}_{\mathrm{L}}=12 \mathrm{~min}$

Assume $\mathrm{T}_{\mathrm{L}}=12 \mathrm{~min}$
$Q_{u}=\frac{L F_{n}}{7.2\left(T_{n}-T_{L}\right) E}=\frac{650 \times 4}{7.2(328-12) 65}=0.018 \frac{\mathrm{ft}^{3}}{\mathrm{~s}} \rightarrow O K$
$T_{a}=328-12=316 \min$
Check flow depth and stream size
Maximum depth of flow $=0.15 \mathrm{ft} \rightarrow \mathrm{OK}$
Minimum allowable $\mathrm{Q}_{\mathrm{u}}=0.00001349 \times 650=0.0088 \rightarrow \mathrm{OK}$

## 94. Given:

IF=1.0
Fn=3 in
sO=0.001 ft/ft
$\mathrm{n}=0.15$
E=75\%
d1=0.3 ft

## Find:

## $\mathbf{Q}_{\mathrm{u}}, \mathrm{T}_{\mathrm{a}}, \mathrm{L}, \mathrm{L}_{\mathrm{e}}$, and $\mathbf{E}$

$\mathrm{T}_{\mathrm{n}}=106 \mathrm{~min}$
$\mathrm{Q}_{\mathrm{u}}=0.049 \mathrm{ft}^{2} / \mathrm{s}$
$\mathrm{T}_{\mathrm{L}}=11 \mathrm{~min}$
$\mathrm{T}_{\mathrm{a}}=\mathrm{T}_{\mathrm{n}}-\mathrm{T}_{\mathrm{L}}=106-11=95 \mathrm{~min}$
$L=7.2 \times 0.049 \times(106-11) \times \frac{75}{3}=838 f t$
$L_{e}=(1-0.75) \times 0.7 \times 0.75 \times 838=110 f t L_{e}$
$F_{g}=720 \times 0.049 \times \frac{(106-11)}{(838+110)}=3.54 \mathrm{in}$
$E=\frac{3}{3.54}=85 \%$
95. Given:

IF=0.3
$\mathrm{L}=275 \mathrm{~m}$

## $\mathrm{S}=0.004 \mathrm{~m} / \mathrm{m}$

$\mathrm{W}=0.75 \mathrm{~m}$
$\mathbf{n}=0.04$
$i_{n}=75 \mathrm{~mm}$
Q=0.6 $1 / \mathrm{s}$

## Find:

$T_{\mathrm{co}}, \mathbf{d}_{\mathrm{ro}}, \mathbf{d}_{\mathrm{dp}}$, and $\mathbf{e}_{\mathrm{d}}$
$\mathrm{g}=1.904 \times 10^{-4}$
$\beta=\frac{\mathrm{gx}}{\mathrm{Q} \sqrt{\mathrm{S}}}=\frac{1.904 \times 10^{-4} \times 275}{0.6 \sqrt{0.004}}=1.38$
$\mathrm{T}_{\mathrm{t}}=\frac{\mathrm{x}}{\mathrm{f}} \exp \beta=\frac{275}{7.61} \exp (1.38)=144 \min$

## OMICE ${ }^{2}$ Books Gfoevp

$$
\mathrm{P}=0.265\left(\frac{\mathrm{Qn}}{\sqrt{\mathrm{~S}}}\right)^{0.425}+0.227=0.265\left(\frac{0.6 \times 0.04}{\sqrt{0.004}}\right)^{0.425}+0.227=0.4 \mathrm{~m}
$$

$\mathrm{T}_{\mathrm{n}}=\left[\frac{\mathrm{i}_{\mathrm{n}} \frac{\mathrm{W}}{\mathrm{P}}-\mathrm{c}}{\mathrm{a}}\right]^{\frac{1}{b}}=\left[\frac{75 \frac{0.75}{0.4}-7}{0.9246}\right]^{\frac{1}{0.72}}=999 \mathrm{~min}$

$$

$$
e_{d}=100 \frac{i_{n}}{i_{g}}=100 \frac{75}{200}=37.5 \%
$$

96. The gross command area of an irrigation project is 1.5 lakh hectares, where 7500 hectare is unculturable. The area of kharif crop is 60000 hectares and that of Rabi crop is 40000 hectares. The duty of Kharif is $3000 \mathrm{ha} / \mathrm{m}^{3} / \mathrm{s}$ and the duty of Rabi is 4000 ha / $\mathrm{m}^{3} / \mathrm{s}$.

Find (a) The design discharge of channel assuming 10\% transmission loss. (b) Intensity of irrigation for Kharif and Rabi.

Culturable command area $=150000-7500=14200$ ha
Discharge for Kharif crop,
Area of Kharif crop $=60000$ ha
Duty of Kharif crop $=3000 \mathrm{ha} / \mathrm{m}^{2}$
Required discharge of channel $=\frac{60000}{3000}=20 \mathrm{~m}^{3} / \mathrm{s}$
Considering 10\% loss
Design discharge $=20 \times \frac{10}{100}=22 \mathrm{~m}^{3} / \mathrm{s}$
Discharge for Rabi crop,
Area of Rabi crop $=40000$ ha
Duty of Kharif crop $=4000 \mathrm{ha} / \mathrm{m}^{2} / \mathrm{s}$
Required discharge of channel $=\frac{40000}{4000}=10 \mathrm{~m}^{3}$
Considering 10\% loss
Design discharge $=10 \times \frac{110}{100}=11 \mathrm{~m}^{3} / \mathrm{s}$
(a) So, the design discharge of the channel should be $22 \mathrm{~m}^{3} / \mathrm{s}$, as it is maximum.
(b) Intensity of irrigation for Kharif $=\frac{60000}{142500}=42.11 \%$

Intensity of irrigation for $\mathrm{Rabi}=\frac{40000}{142500}=28.07 \%$
97. The gross command area of an irrigation project is 1 lakh hectares. The culturable command area is $\mathbf{7 5 \%}$ of G.C.A. The intensities of irrigation for Kharif and Rabi are 50\% and $55 \%$ respectively. If the duties for Kharif and Rabi are $1200 \mathrm{ha} / \mathrm{m}^{3} / \mathrm{s}$ and 1400 ha / $\mathbf{m}^{\mathbf{3}} / \mathrm{s}$ respectively, determine the discharge at the head of the canal considering $20 \%$ provisions for transmission loss, overlap allowance, evaporation loss etc.

Culturable command area $=100000 \times \frac{75}{100}=75000$ ha
For Kharif crop,

## QMICEBooks <br> Group

Area under Kharif $=75000 \times \frac{50}{100}=37500$ ha Duty of Kharif $=1200 \mathrm{ha} / \mathrm{m}^{2} / \mathrm{s}$
Required discharge for Kharif $=\frac{37500}{1200}=31.25 \mathrm{~m}^{3} / \mathrm{s}$
For Rabi crop,
Area under Rabi $=75000 \times \frac{55}{100}=41250$ ha Duty of Rabi $=1400 \mathrm{ha} / \mathrm{m}^{3} / \mathrm{s}$
Required discharge for Rabi $=\frac{41250}{1400}=29.46 \mathrm{~m}^{3} / \mathrm{s}$
So, to meet up the actual water requirement of the crops, the discharge of the canal at the head of the field should be $31.25 \mathrm{~m}^{3} / \mathrm{s}$ (as it is maximum). Now considering $20 \%$ provision for losses,

Required discharge at the head of canal $=31.25 \times \frac{120}{100}=37.5 \mathrm{~m}^{3} / \mathrm{s}$
98. Determine the head discharge of a canal from the following data. The value of time factor may be assumed as 0.75.

| Crop | Base period in days | Area in hectare | Duty in hec tares/cumec |
| :---: | :---: | :---: | :---: |
| Rice | 120 | 4000 | 1500 |
| Wheat | 120 | 3500 | 2000 |
| sugarcane | 310 | 3000 | 1200 |

Discharge of canal required
(a) For rice $=\frac{4000}{1500}=2.667 \mathrm{~m}^{3} / \mathrm{s}($ Kharif $)$
(b) For wheat $=\frac{3500}{2000}=1.75 \mathrm{~m}^{3} / \mathrm{s}($ Rabi $)$
(c) For sugarcane $=\frac{3000}{1200}=2.5 \mathrm{~m}^{3} / \mathrm{s}($ perennial $)$

As, the base period of sugarcane is 310 days, it will require water both in Kharif and Rabi seasons.

Now, actual discharge required in Kharif season $=2.667+2.5=5.167 \mathrm{~m}^{3} / \mathrm{s}$.
Actual discharge required in Rabi season $=1.75+2.5=4.25 \mathrm{~m}^{3} / \mathrm{s}$.
So, the maximum discharge in Kharif season (i.e., $5.167 \mathrm{~m}^{3} / \mathrm{s}$ ) should be taken into consideration as it will be able to serve both the seasons.

Time factor $=0.75=\frac{\text { Actual discharge }}{\text { Design discharge }}=\frac{5.167}{\text { Design discharge }}$

Design discharge $=\frac{5.167}{0.75}=6.889 \mathrm{~m}^{3} / \mathrm{s}$
Therefore, the required head discharge of the canal is $6.889 \mathrm{~m}^{3} / \mathrm{s}$.
99. Find out the capacity of a reservoir from the following data. The cultivable command area is $\mathbf{8 0 0 0 0}$ hectares.

| Crop | Base period in days | Duty in hect/cumec | Intensity of irrigation in percentage |
| :---: | :---: | :---: | :---: |
| Rice | 120 | 1800 | 25 |
| Wheat | 120 | 2000 | 30 |
| sugarcane | 310 | 2500 | 20 |

Assume the canal and reservoir losses as 5\% and 10\% respectively.
$\Delta=\frac{8.64 \times \mathrm{B}}{\mathrm{D}}$
Calculation of delta for each crop

$$
\Delta_{\text {rice }}=\frac{8.64 \times 120}{1800}=0.576 \mathrm{~m} \Delta_{\text {wheat }}=\frac{8.64 \times 120}{2000}=0.518 \mathrm{~m} \Delta_{\text {sugarcane }}=\frac{8.64 \times 320}{2500}=1.106 \mathrm{~m}
$$

Calculation of area for each crop

$$
\mathrm{A}_{\text {rice }}=\frac{80000 \times 25}{100}=20000 \mathrm{ha}
$$

$$
\mathrm{A}_{\text {wheat }}=\frac{80000 \times 30}{100}=24000 \mathrm{ha}
$$

$$
\mathrm{A}_{\text {sugarcanc }}=\frac{80000 \times 20}{100}=16000 \mathrm{ha}
$$

Volume of water required for each crop
$\mathrm{V}_{\text {rice }}=20000 \times 0.576=11520$ ha -m
$\mathrm{V}_{\text {wheat }}=20000 \times 0.518=12432$ ha -m
$\mathrm{V}_{\text {rice }}=16000 \times 17696$ ha -m

Total volume of water=41648 ha-m.

Considering canal loss of 5\%
Water required at the head of canal $=41648 \times \frac{105}{100}=43730.4 \mathrm{ha}-\mathrm{m}$
Again considering, reservoir loss of 10\%

Capacity of reservoir $=43730.4 \times \frac{110}{100}=48103.44 \mathrm{ha}-\mathrm{m}$
100. The command area of a channel is 4000 hectares. The intensity of irrigation of a crop is $70 \%$. The crop requires 60 cm of water in 15 days, when the effective rainfall is recorded as 15 cm during that period.

Find, (a) The duty at the head of field. (b) The duty at the head of channel. (c) The head discharge at the head of channel.

Assume total losses as $15 \%$.
Depth of water required $=60 \mathrm{~mm}$
Effective rainfall=15 cm
Depth of irrigation water $=60-15=45 \mathrm{~cm}$
$\Delta=45 \mathrm{~cm}$
$B=15$ days

$$
\Delta=\frac{8.64 \times \mathrm{B}}{\mathrm{D}} \text { Duty }=\mathrm{D}=\frac{8.64 \times 15}{0.45}=288 \frac{\mathrm{ha}}{\text { cumec }}
$$

(a) So, duty at the head of field=288 ha/cumec. Due to the losses of water the duty at the head of the channel will be reduced.

Here, losses are $15 \%$.
(b) So, the duty at the head of channel $=288 \times 0.85=244.8$ ha/cumec (Duty will be reduced due to loss).

Total area under crop $=4000 \times 0.7=2800$ ha
(c) The discharge at the head of channel $=2800 / 244.8=11.438$ cumec
